

Update from NIMH

Joshua A. Gordon, M.D., Ph.D.
Director,
National Institute of Mental Health

June 7, 2018

National Institute
of Mental Health

NIMH Mission

MISSION

To transform the understanding and treatment of mental illnesses through basic and clinical research, paving the way for prevention, recovery, and cure.

www.nimh.nih.gov

Research = Hope

About the NIMH

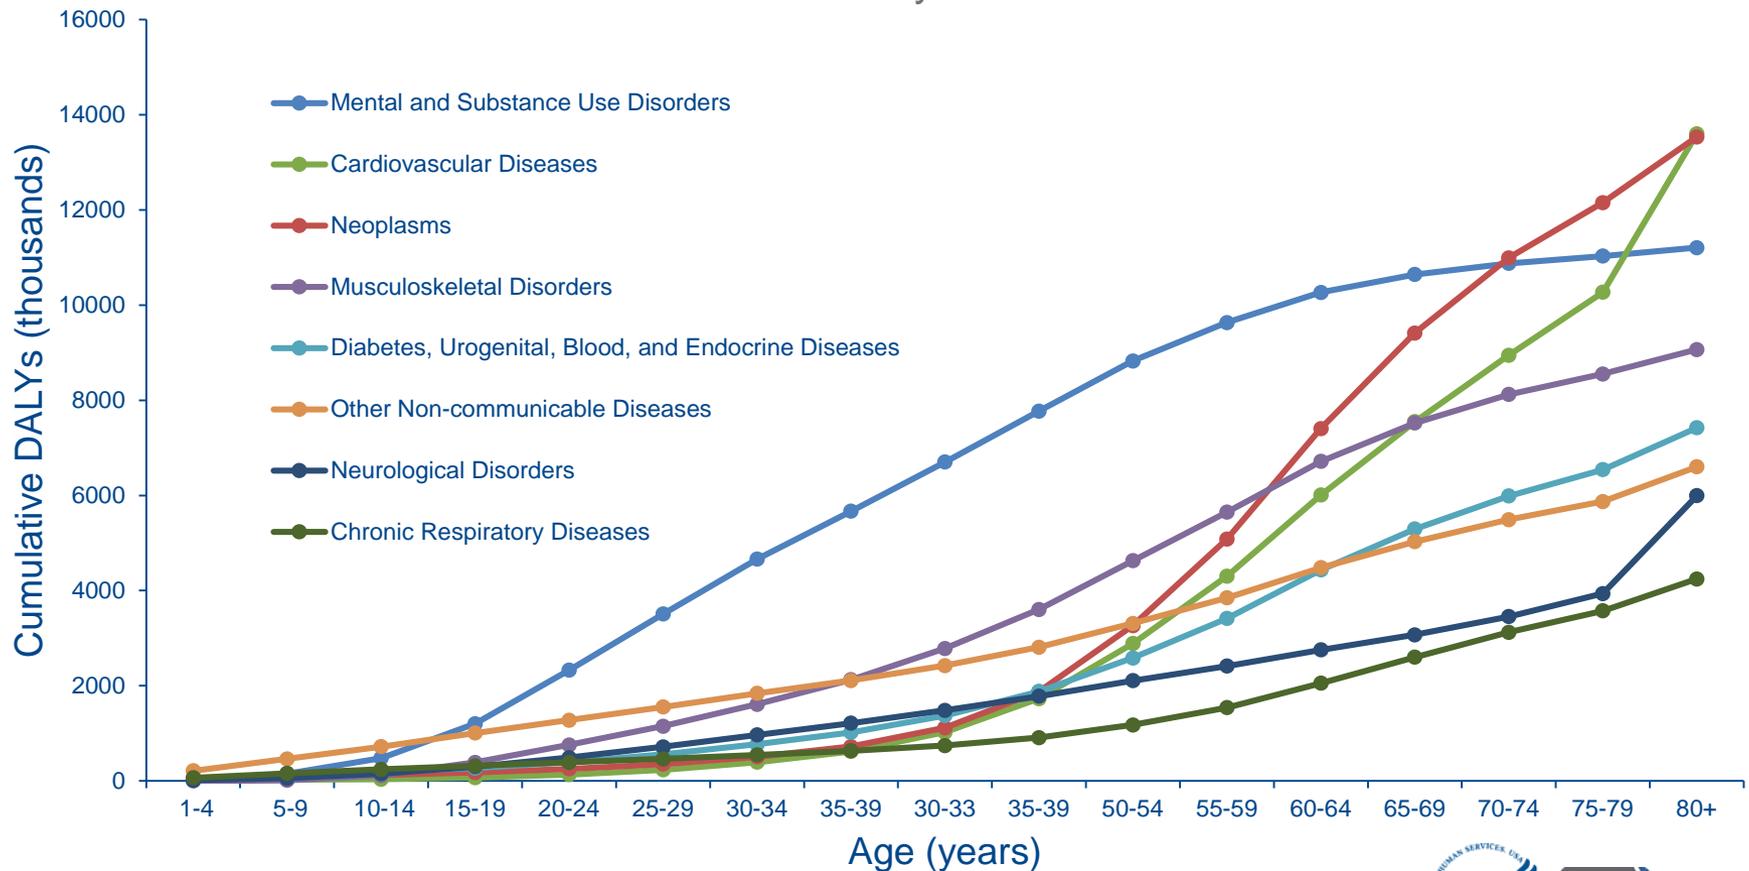

- The National Institute of Mental Health (NIMH) is the lead federal agency for research on mental illnesses.
- NIMH supports more than 3,000 research grants and contracts at universities and other institutions across the country and overseas.
- NIMH intramural research programs support approximately 600 scientists working on the NIH campuses.

Burden of Mental Illness – U.S. DALYs

Cumulative U.S. DALYs for the Leading Disease/Disorder Categories by Age (2015)

Data Courtesy of IHME

Agenda

- NIMH Strategic Research Priorities
- Neurodevelopmental Perspective
- Early Identification and Intervention Across the Lifespan
- Challenges and Opportunities

NIMH Strategic Plan for Research

Objective 1:

Define the mechanisms of complex behaviors

Objective 2:

Chart mental illness trajectories to determine when, where, and how to intervene

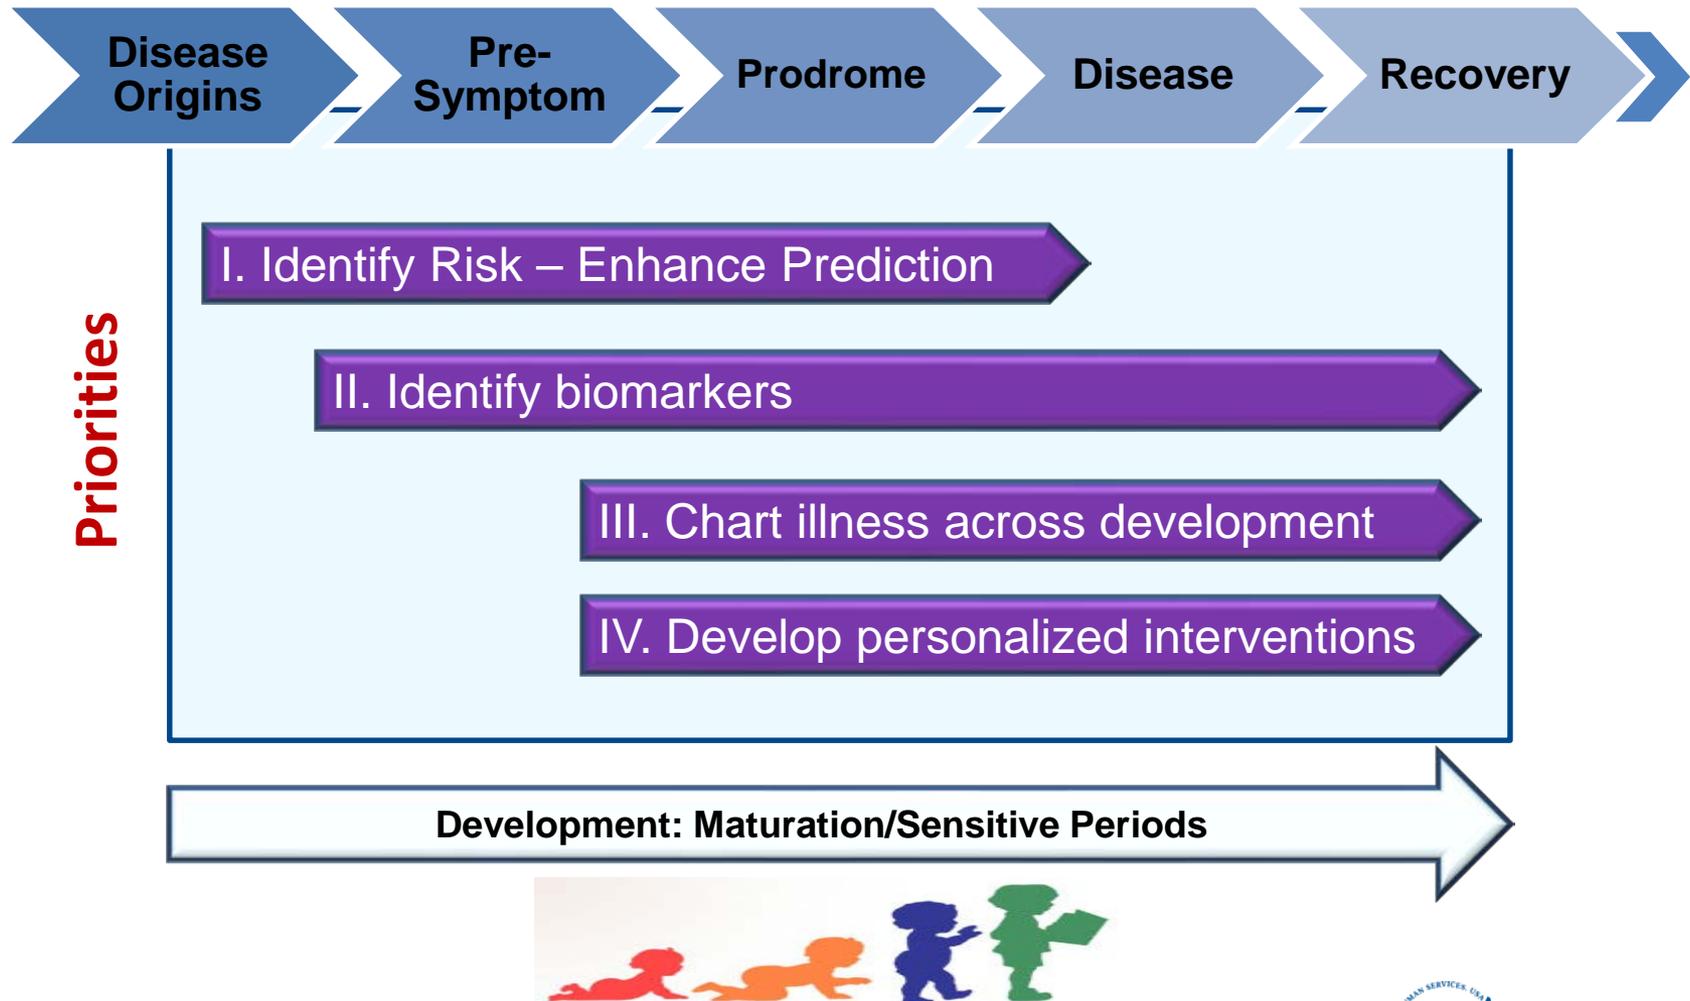

Objective 3:

Strive for prevention and cures

Objective 4:

Strengthen the public health impact of NIMH-supported research

NIMH Strategic Plan for Research

Agenda

- NIMH Strategic Research Priorities
- Neurodevelopmental Perspective
- Early Identification and Intervention Across the Lifespan
- Challenges and Opportunities

(Neuro)developmental Perspective

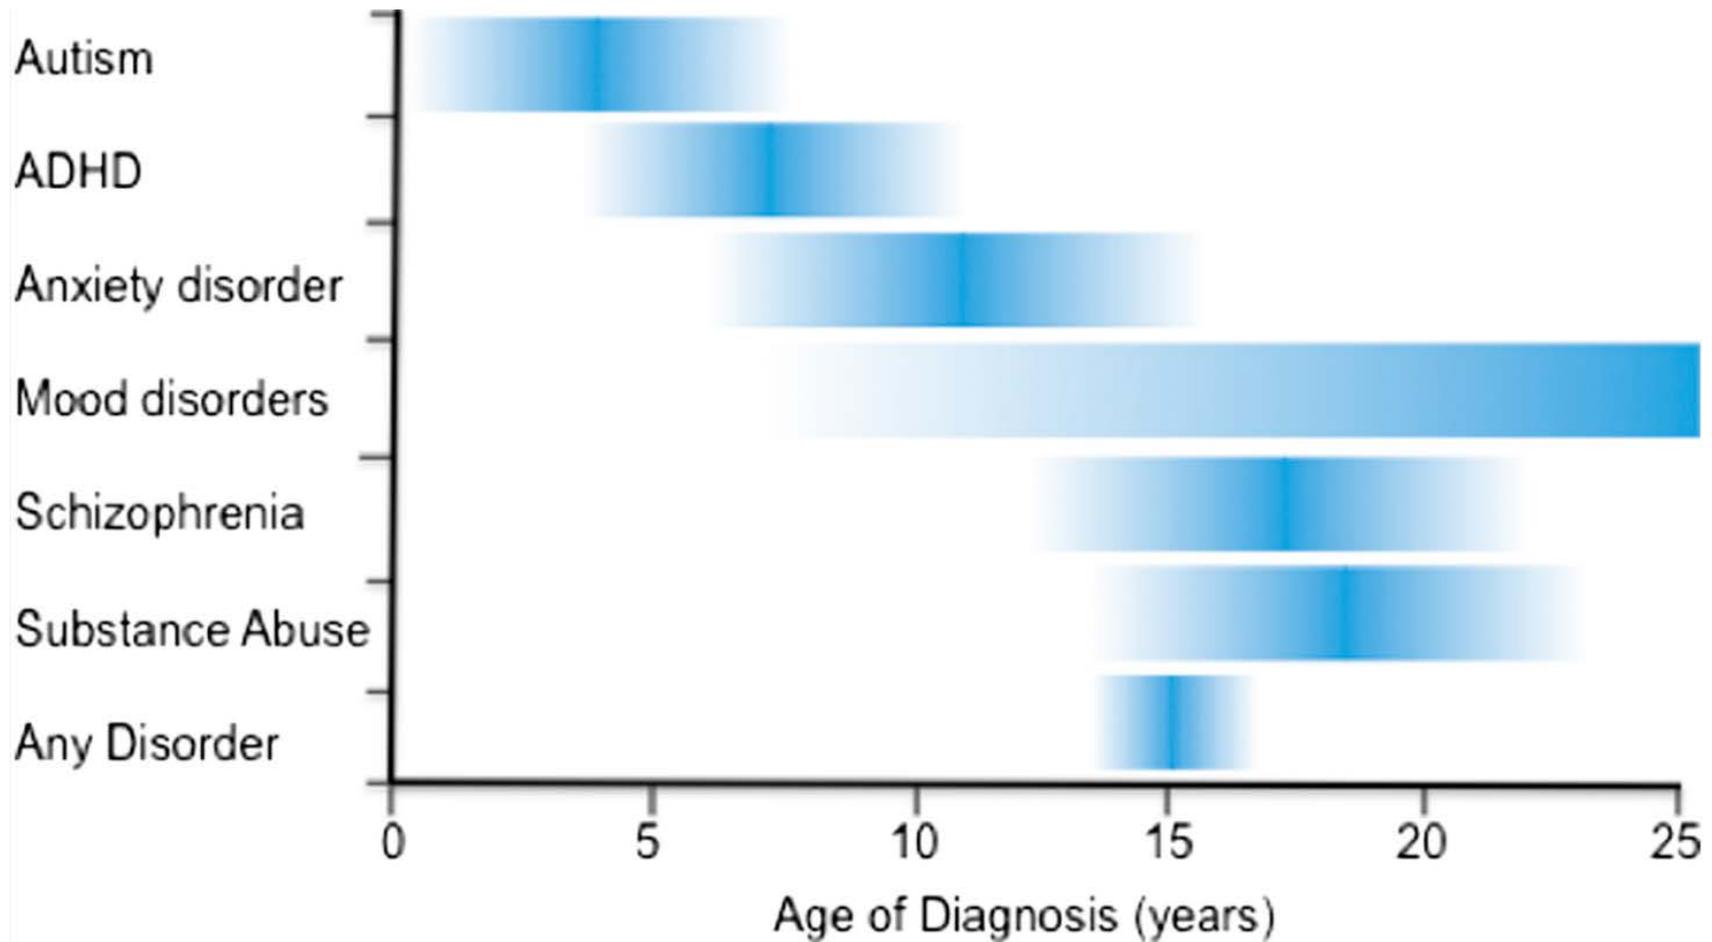

Early & Differential Onset

Roots in Neurodevelopment

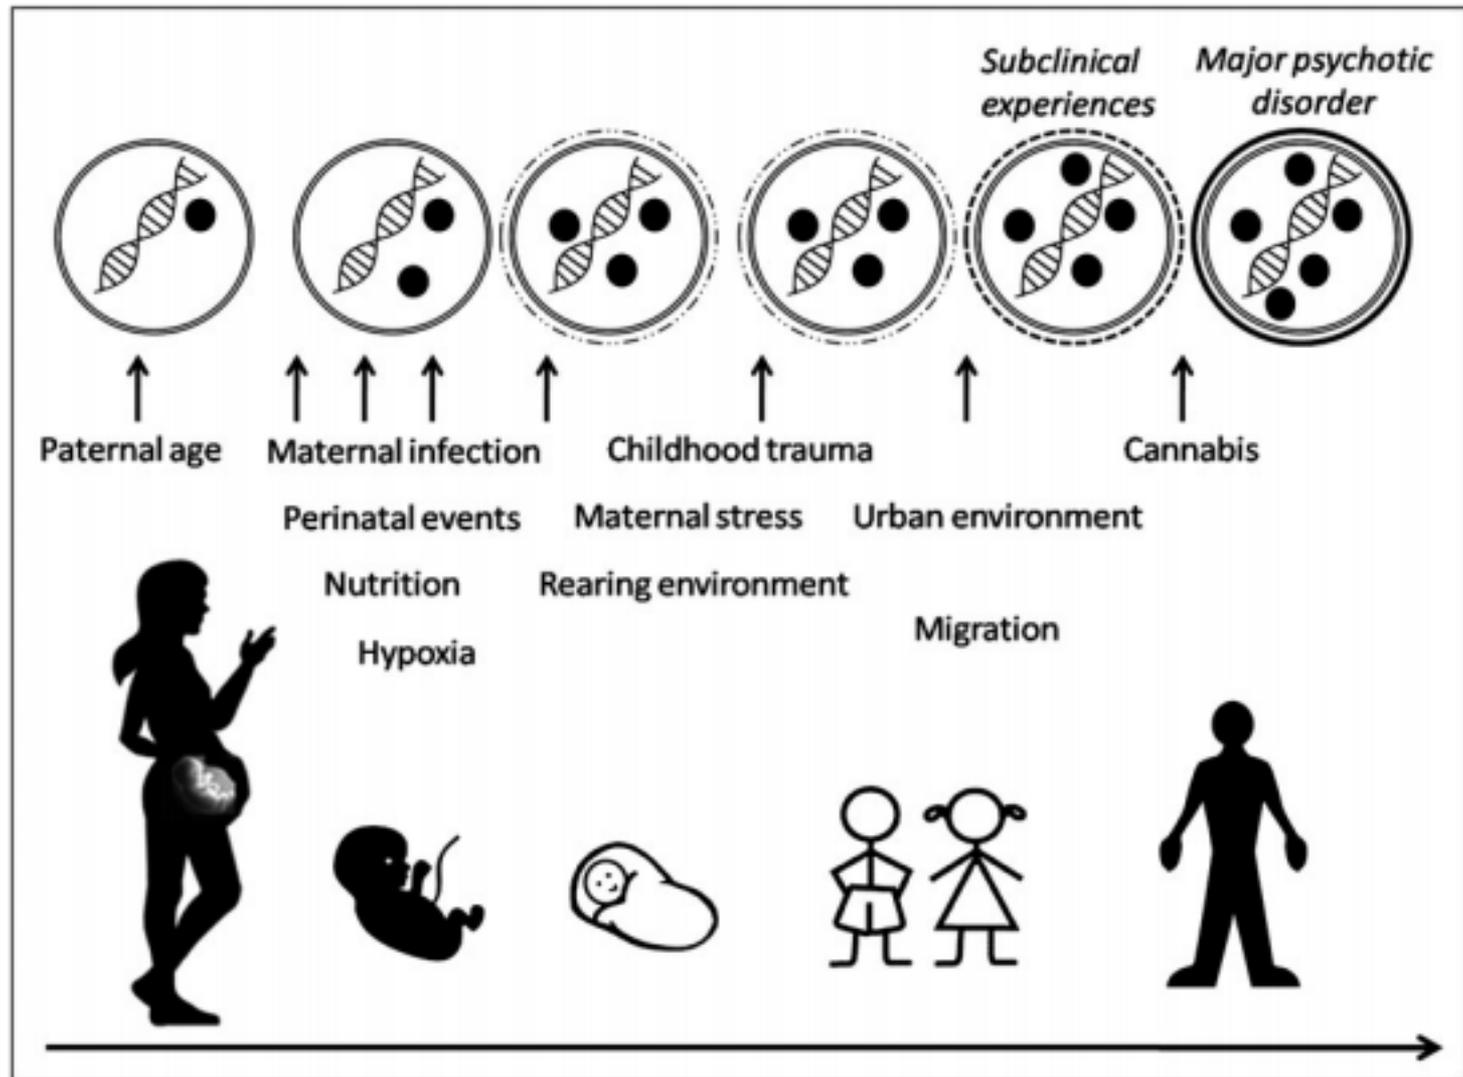

Early insult alters trajectories

Early interventions improve outcomes

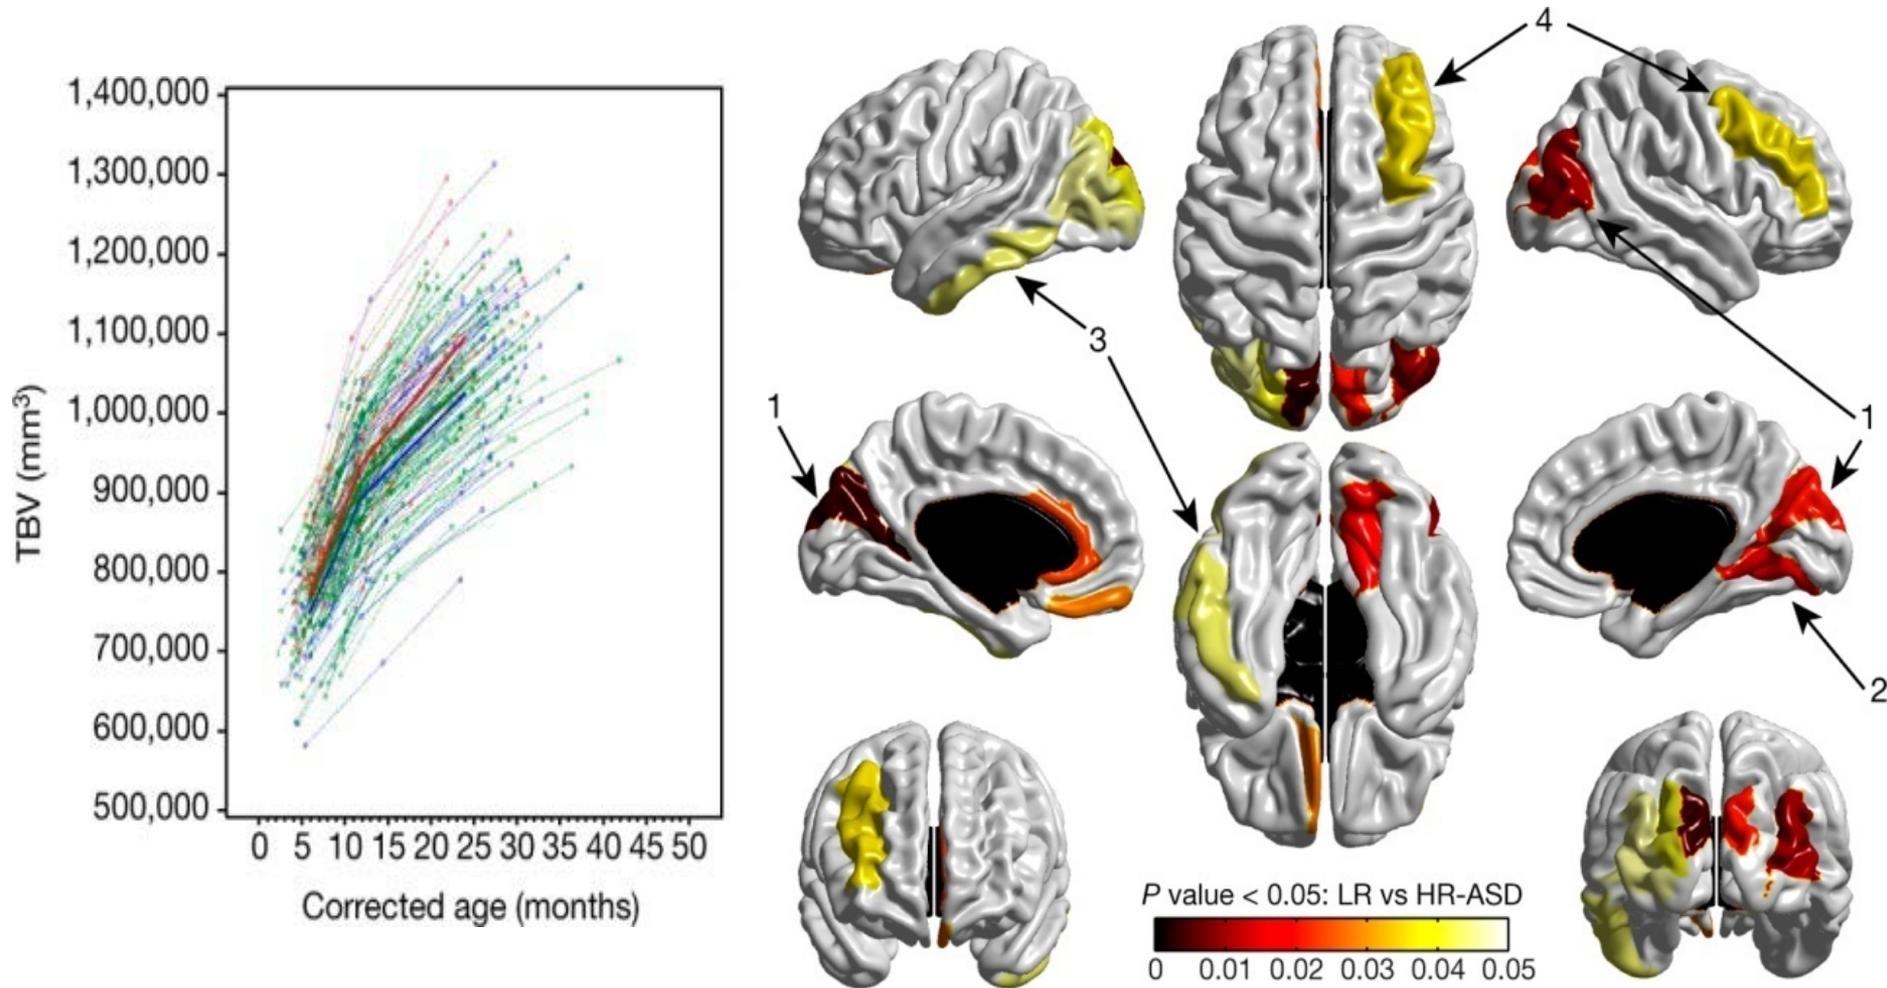

Psychiatric Disorders Onset During Childhood and Adolescence

Neurodevelopmental Roots and Risk

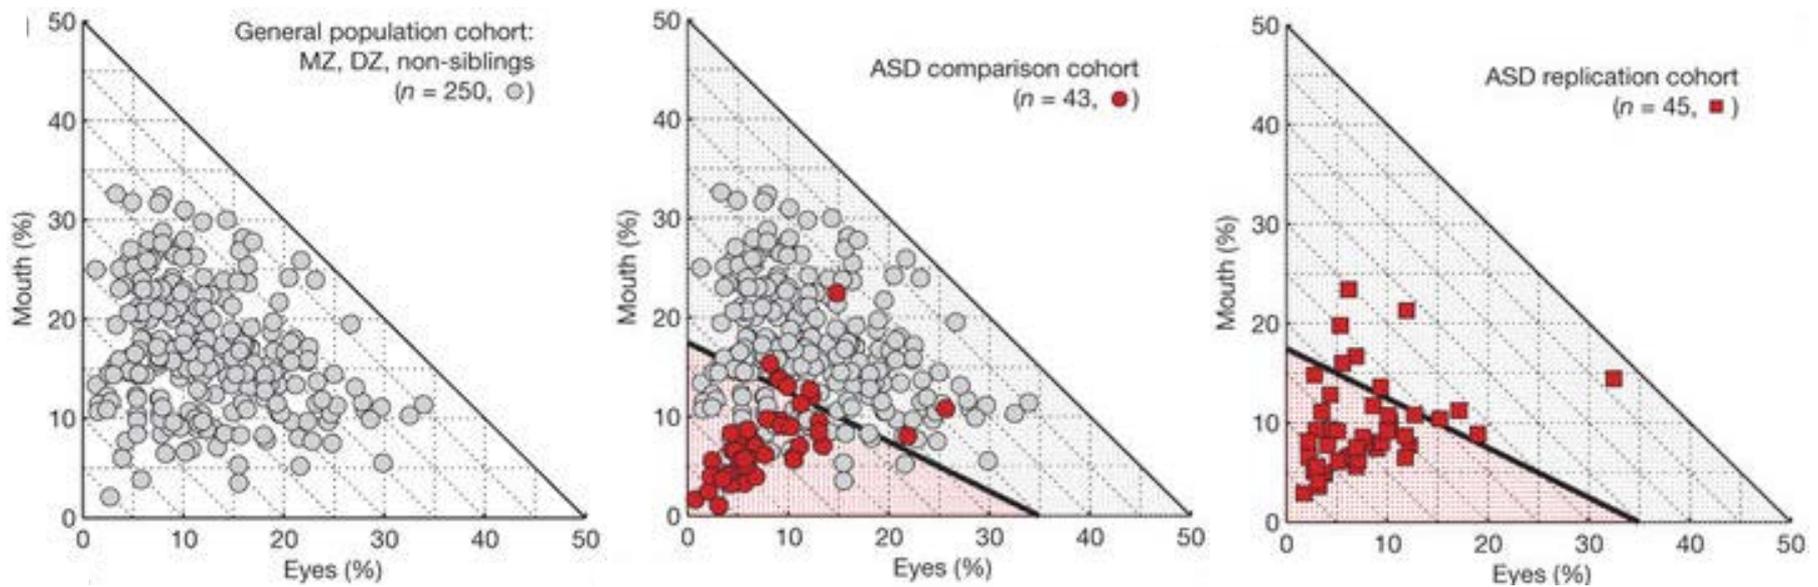

Early Trajectories Predict ASD

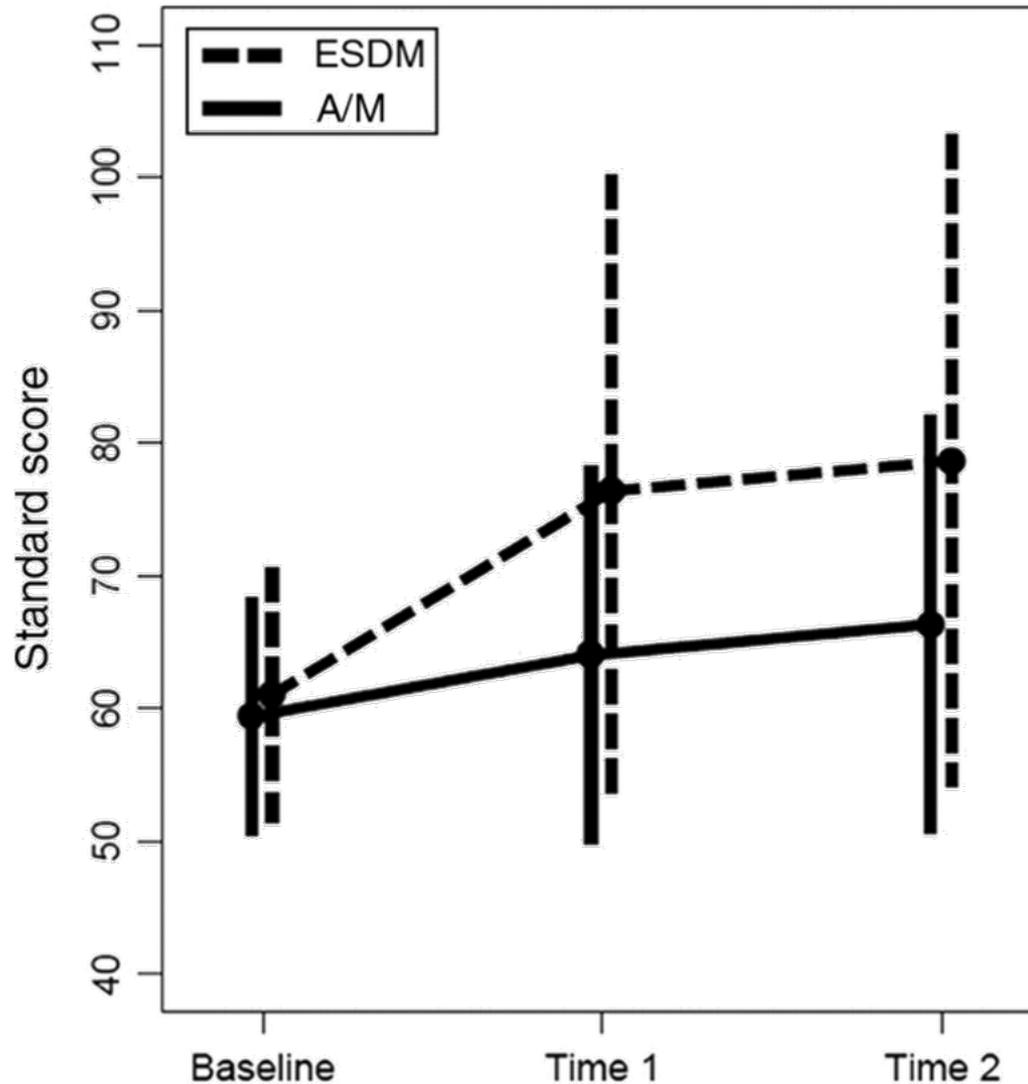

Hazlett, *Nature*, 2017

Children's Early Visual Behavior Predicts Autism

Constantino, *Nature*, 2017

Early Interventions May Improve Outcomes

Autism Spectrum Disorder (ASD) Services Research Across the Lifespan (ServASD)

- ASD Screening, Evaluation and Engagement in Treatment and Services in the First Two Years of Life
- Pilot Studies on Services for Transition-Age Youth
- Pilot Studies on Services for Adults with ASD

Agenda

- NIMH Strategic Research Priorities
- Neurodevelopmental Perspective
- Early Identification and Intervention Across the Lifespan
- Challenges and Opportunities

Suicide Screening and Intervention

Universal Screening Plus Intervention Reduces Number of Suicide Attempts

Figure 2. Total Suicide Attempts per Participant by Phase

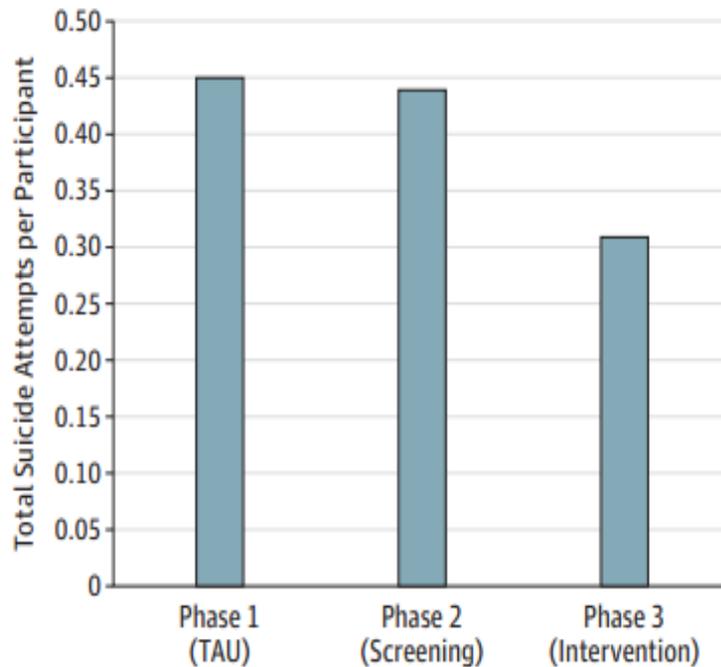

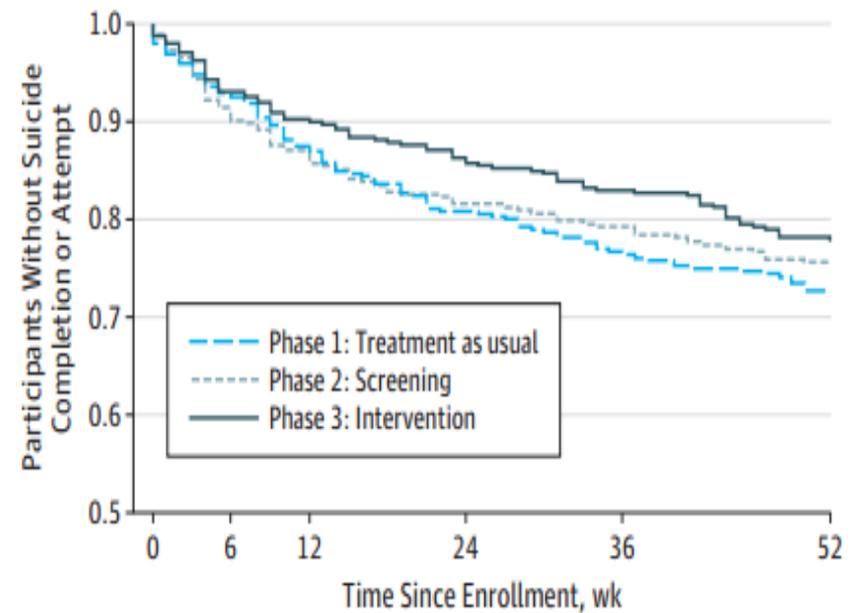

Figure 3. Proportion of Participants Who Did Not Make a Suicide Attempt Over Time

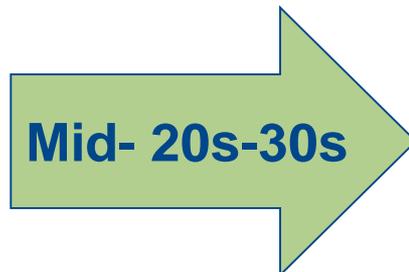

ServASD: Developmental Milestones

- Increased independence
 - Social relationships
- Work habits & problem-solving
 - Future planning

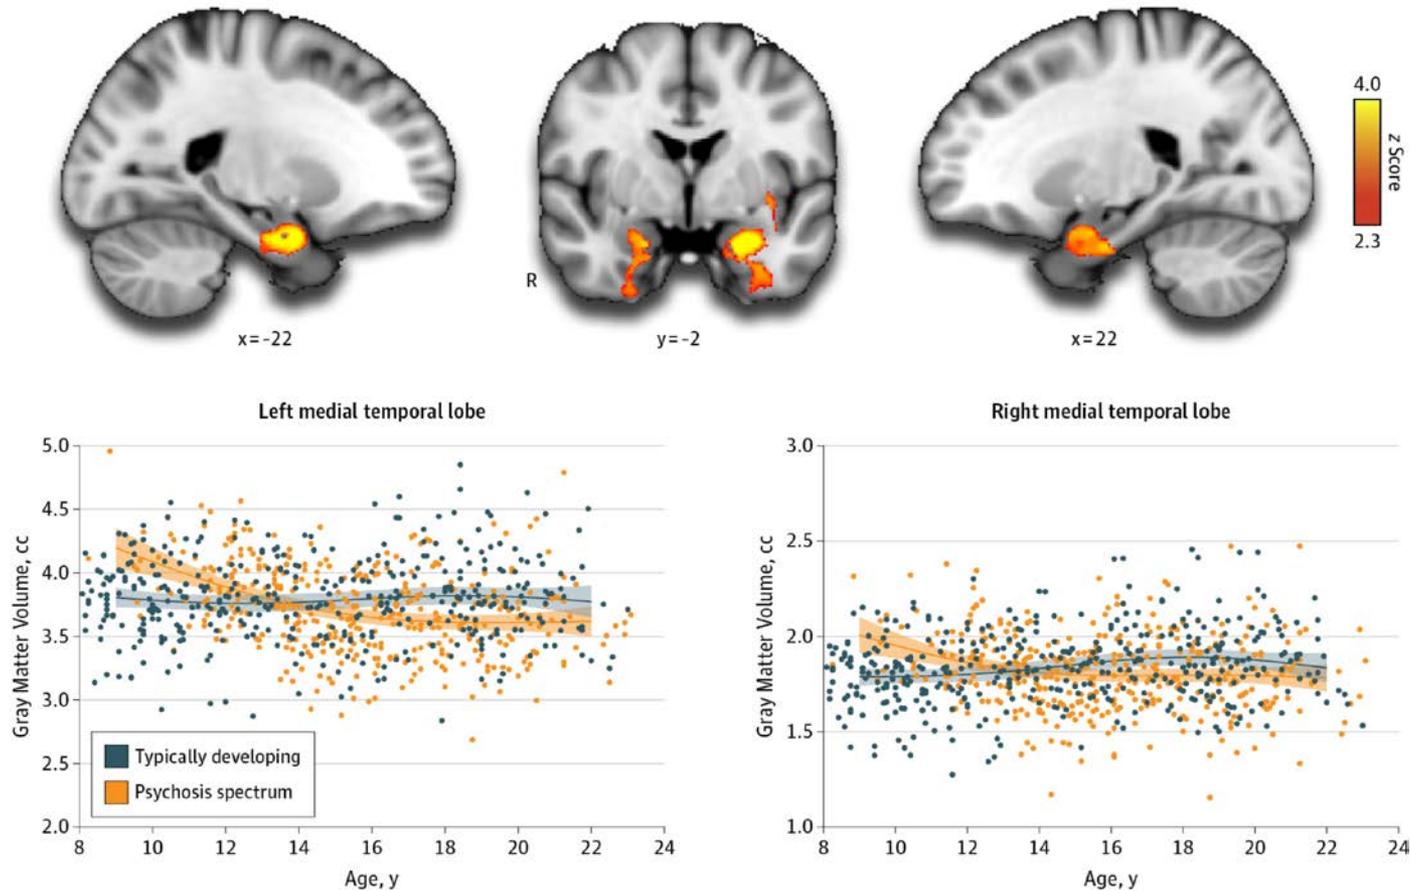

- Beginning work life
- Health & stress management
 - Adult relationships
 - Independent living

- Established friends & community
- Continued & new health management
 - Long-term planning

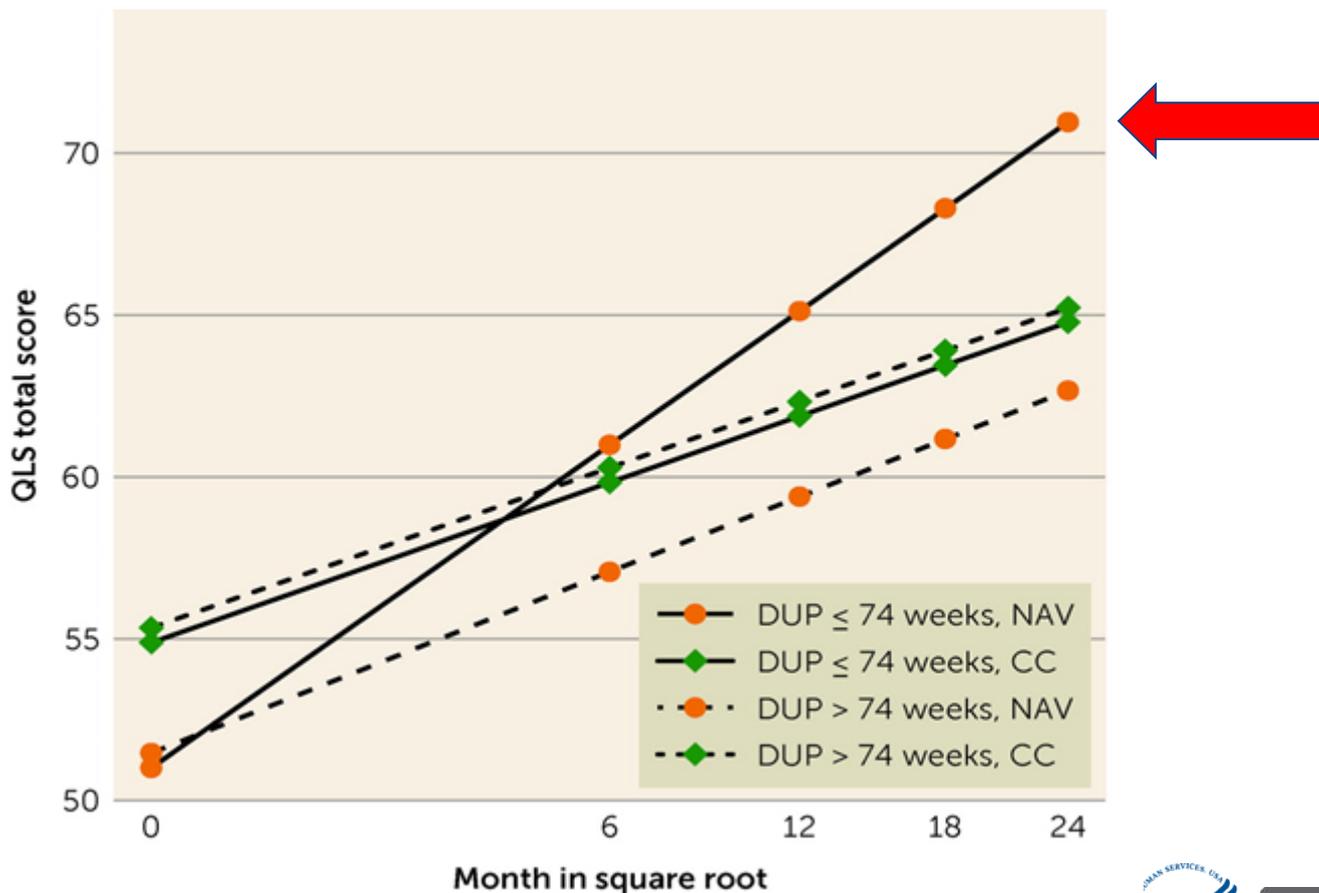

Structural Brain Abnormalities in Youth With Psychosis Spectrum Symptoms

Data from the Philadelphia Neurodevelopmental Cohort

Recovery After an Initial Schizophrenia Episode (RAISE)

Participants with shorter duration of untreated psychosis had greater improvement in quality of life and psychopathology over 2 years

The Importance of Early Identification & Access to Services

Current Initiative:

Initiation of a Mental Health Family Navigator Model to Promote Early Access, Engagement and Coordination of Needed Mental Health Services for Children and Adolescents

(PAR-18-428 & PAR-18-429)

These announcements encourage research to develop and test the effectiveness and implementation of family navigator models to:

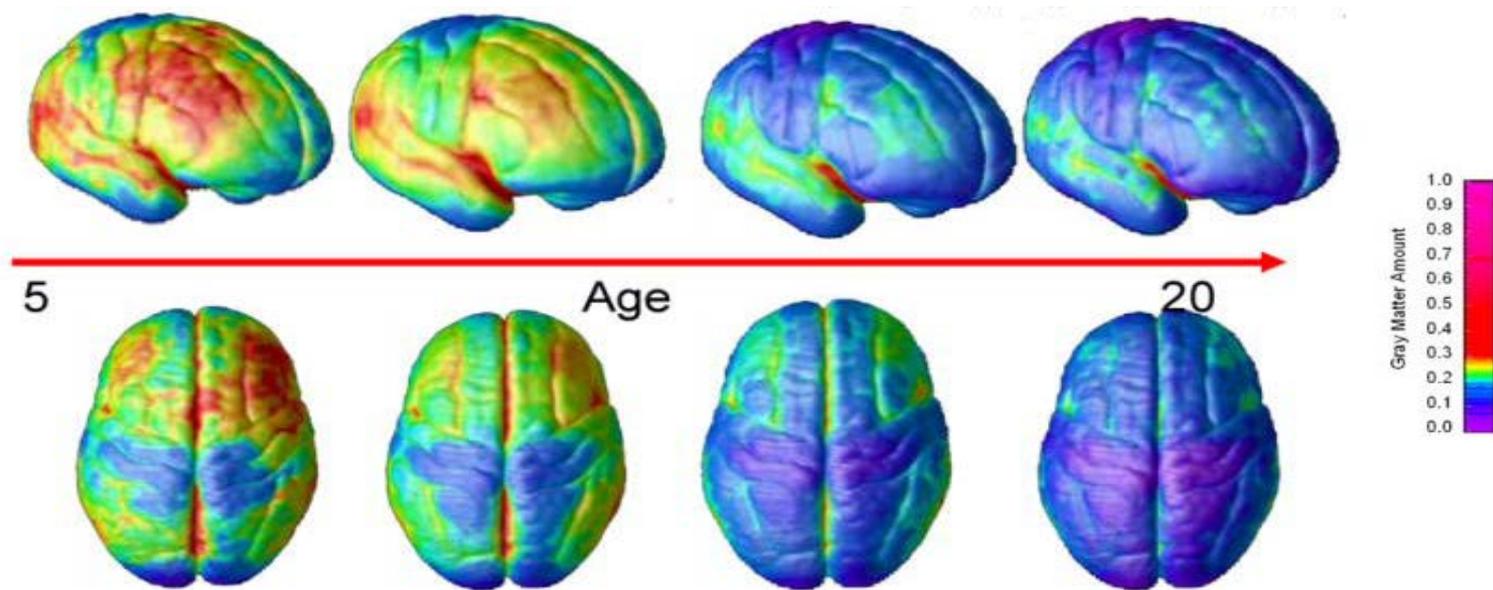

- Promote early access, engagement and coordination of treatment and services
- Specially address children and adolescents experiencing early symptoms of mental health problems

Agenda

- NIMH Strategic Research Priorities
- Neurodevelopmental Perspective
- Early Identification and Intervention Across the Lifespan
- Opportunities in the Era of Big Data

Challenge: Non-linear, Non-uniform Changes Across the Lifespan

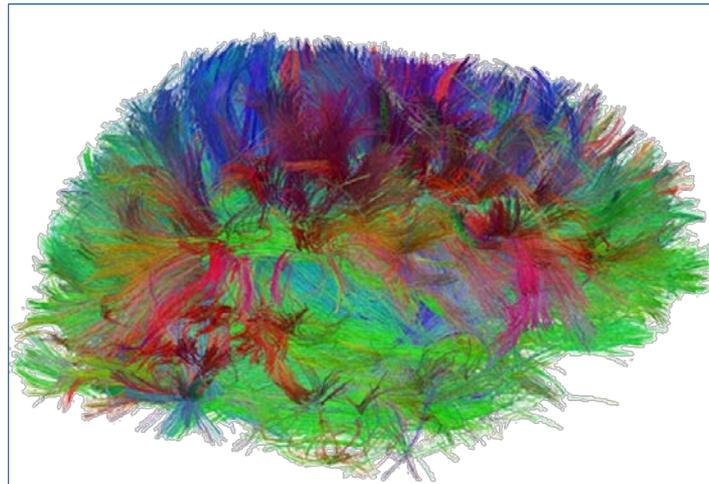

- Development is a non-linear, non-uniform, process
- Aging is a non-linear, non-uniform, process
- Environment changes, and it matters

Gogtay and Thompson, *Brain Cogn.* 2010:
Adapted from Giedd et al. *Nature Neuroscience*, 1999

Human Connectome Project (HCP)

- Map the neural pathways that underlie human brain function
- Deciphering the brain's complex wiring system
 - Mapping the connectomes in over 1,000 healthy adults
 - Optimizing MRI technology for imaging brain structure

Lifespan Connectome

- **Baby Connectome:**
 - Ages 0-5 years; 500 participants; cross-sectional and longitudinal
- **Development Connectome:**
 - Ages 5-21 years; 1350 participants; cross-sectional and longitudinal
- **Young Adult Connectome (initial HCP)**
 - Ages 22-35; 1200 participants, twin pairs, siblings
- **Aging Connectome:**
 - Ages 36 – 100; 1200 participants

Big Data Approaches

Adolescent Brain Cognitive Development (ABCD) Study

- Longitudinal study of ~10,000 children from ages 9-10 through early adulthood

All of Us Research Program

- Over 1 million participants; now Beta testing

NIMH Mission

MISSION

To transform the understanding and treatment of mental illnesses through basic and clinical research, paving the way for prevention, recovery, and cure.
