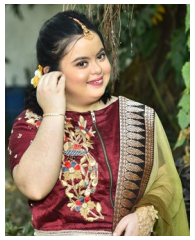
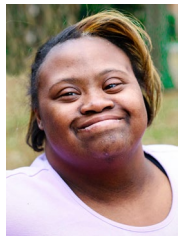
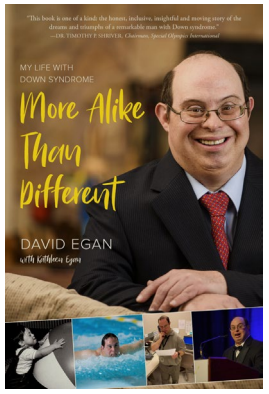
DS-Connect® The Down Syndrome Registry

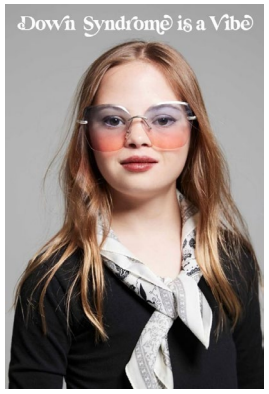
Down syndrome:

A diverse population surpassing all expectations









There are more persons alive with Down syndrome today than ever before.

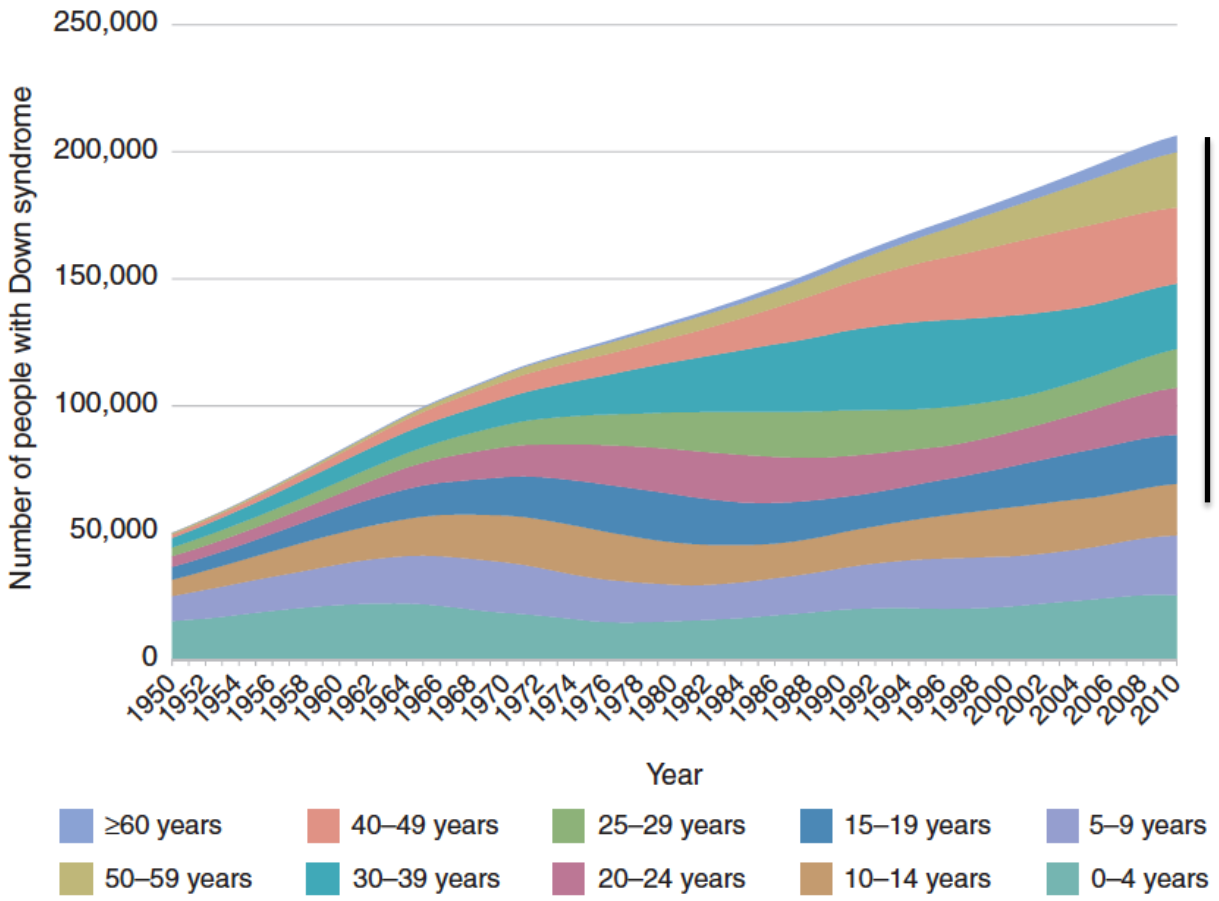
People with Down syndrome are living longer than ever before.

Individuals with Down syndrome are defying outdated notions about what is possible when living with an extra chromosome.

Down syndrome:

A growing population with many unmet needs

Down syndrome **IS NOT** a ‘rare disease’



Adults!

DeGraaf et al, 2017

The birth rate has not decreased.

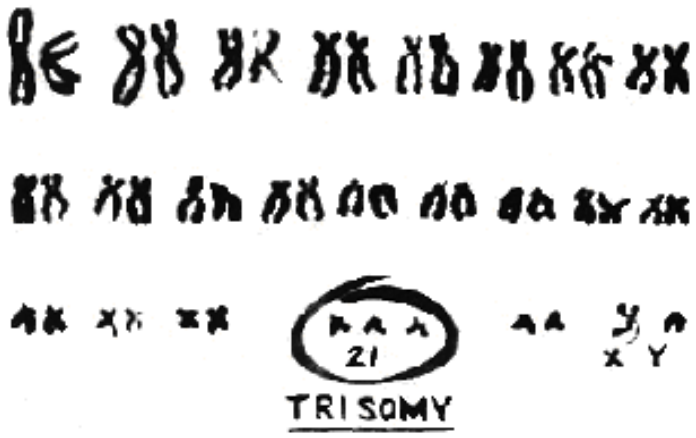
Large gains in life expectancy have led to significant growth of the population with Down syndrome.

Life expectancy is now ~60 years.

People with Down syndrome are here to stay…

Down syndrome:

The ultimate challenge in precision personalized medicine



Gautier

Turpin

Lejeune

The chromosomal abnormality causing Down syndrome (i.e., trisomy 21) has been known since the late 1950's.

Chromosome 21 was sequenced back in 2000, leading to the identification of ~225 genes.

No mutations, simply 1.5x gene dosage.

How does an extra chromosome 21 causes the various hallmarks of Down syndrome?

People with Down syndrome have a different ‘clinical risk profile’

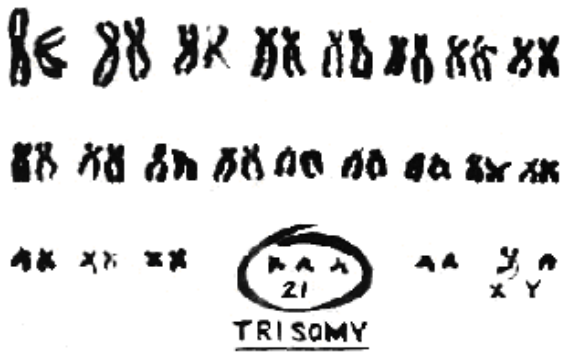
Cancer

Atherosclerosis

Hypertension

Allergies

Common (but variable) traits:
Neurodevelopmental delay
Stunted growth
Early ageing



Alzheimer’s

Autoimmunity

Lung infections

Vision & Hearing

Congenital heart disease, autism spectrum disorders, seizures disorders, and more…

To help people with Down syndrome live longer and healthier lives, we must study the **co-occurring conditions** of Down syndrome

2017: an inflexion point

Congressional hearing on Down syndrome research

U.S.A. House of Representatives

October 25th, 2017

Michelle Sie Whitten, Dr. Joaquin Espinosa, Dr. William. Mobley, Frank Stephens

Frank Stephens:
'I am a man with Down syndrome, and my life is worth living'

Dr. Francis Collins, Frank Stephens

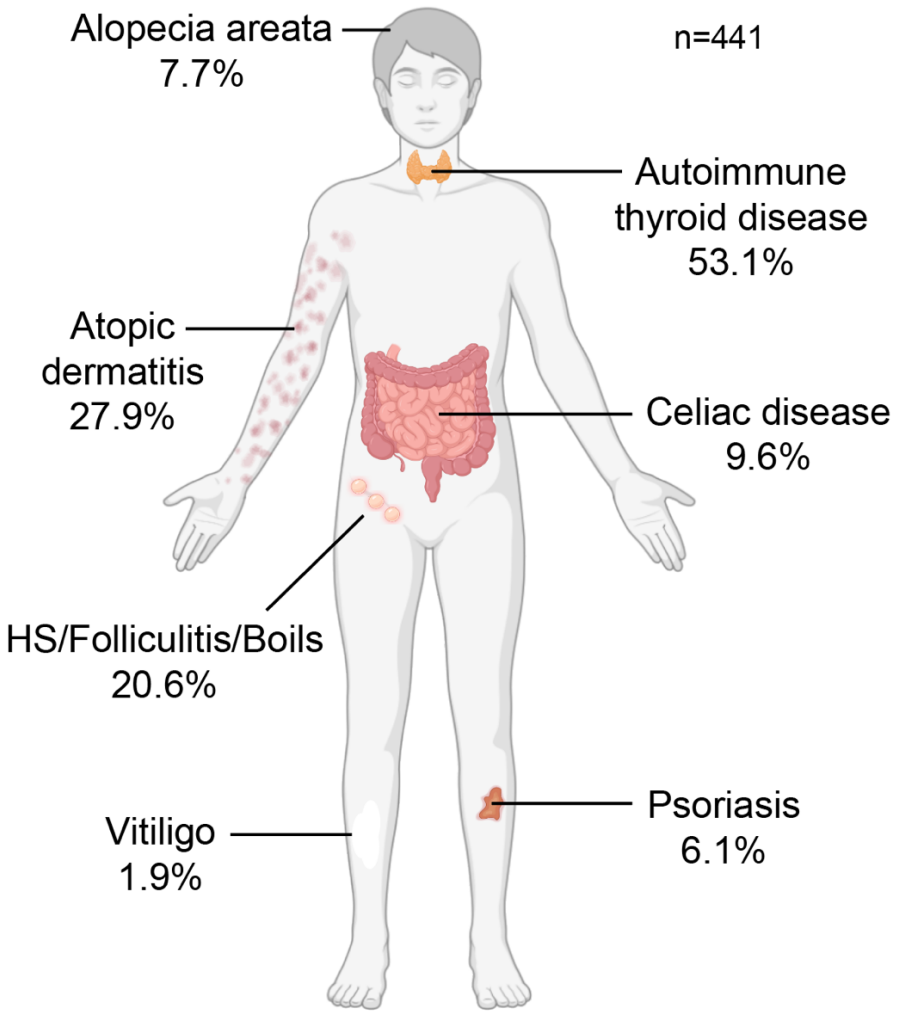
Key observation: widespread autoimmunity in Down syndrome



Rachubinski et al, eLIFE 2024

~75% of adults with Down syndrome have been diagnosed with at least one autoimmune condition

>50% of people with Down syndrome have autoimmune thyroid disease (AITD), leading to **hypo**thyroidism or **hyper**thyroidism

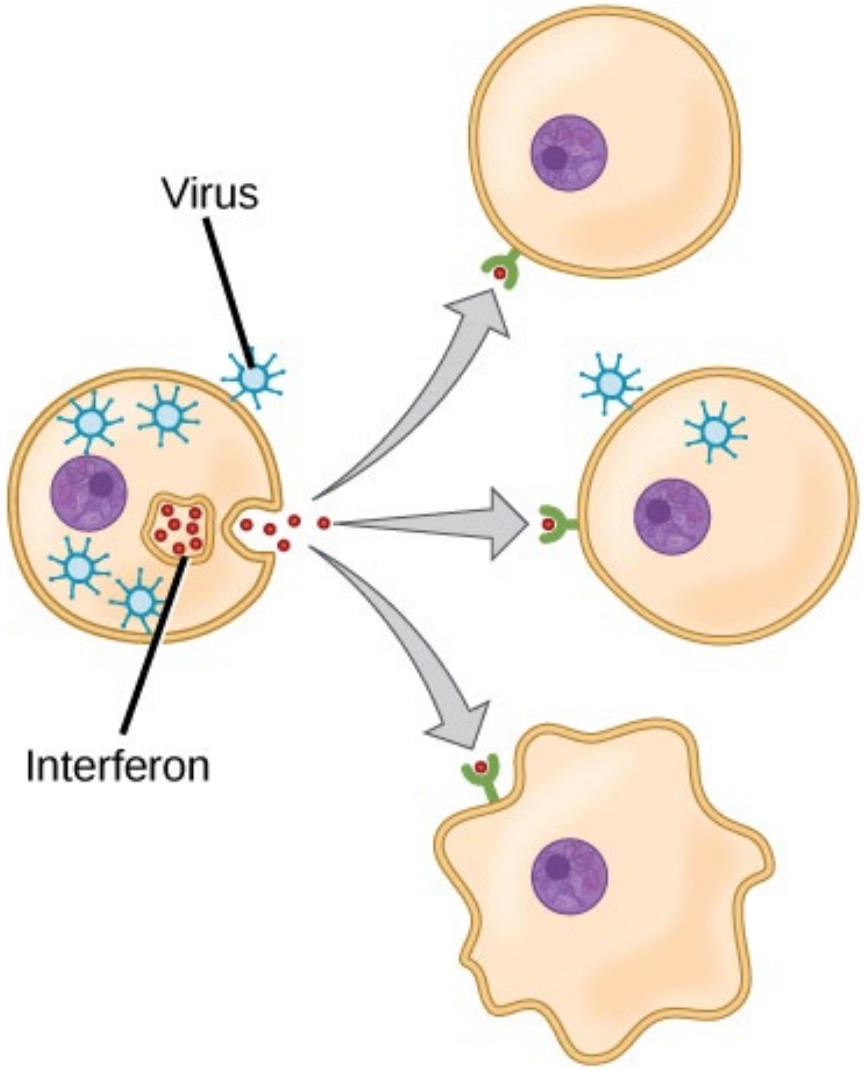
>35% adults with Down syndrome have been diagnosed with one or more autoimmune skin conditions

~10% of adults with Down syndrome have been diagnosed with celiac disease

Type I diabetes, 'Down syndrome arthropathy', and other, more rare autoimmune conditions, are also more common

>80% of these autoimmune conditions are diagnosed during pediatric age.

People with Down syndrome have hyperactive interferon signaling



Interferon (IFN) signaling is an important part of the immune system involved in the anti-viral defense.

Interferons are ‘cytokines’ that activate many different types of immune cells.

Interferon hyperactivity is a known risk factor for autoimmunity.

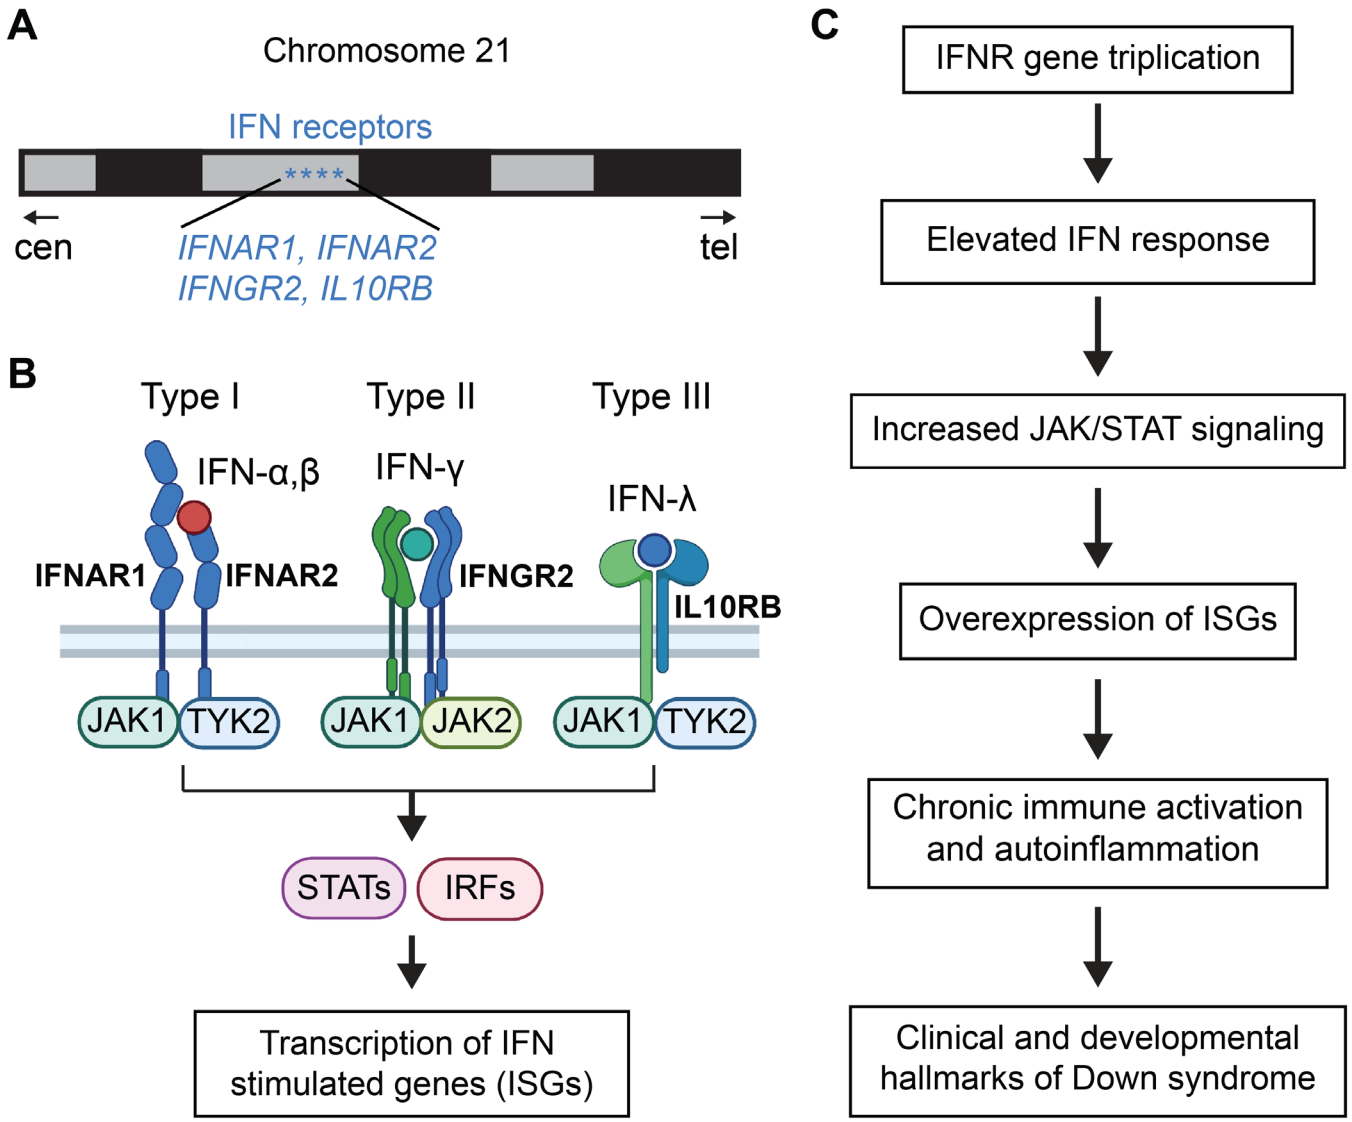
Trisomy 21 consistently activates the interferon response

Kelly D Sullivan[1,2,3,4]*, Hannah C Lewis[1,2], Amanda A Hill[1,2], Ahwan Pandey[1,2,3,4], Leisa P Jackson[1,3,4], Joseph M Cabral[1,3,4], Keith P Smith[1], L Alexander Liggett[1,5], Eliana B Gomez[1,3,4], Matthew D Galbraith[1,2,3,4], James DeGregori[1,5,6,7,8,9], Joaquín M Espinosa[1,2,3,4]*

eLIFE elifesciences.org

Sullivan et al, eLIFE 2016

Why do people with Down syndrome have hyperactive interferon signaling?



Four interferon receptors (IFNRs) are encoded on chromosome 21!!!

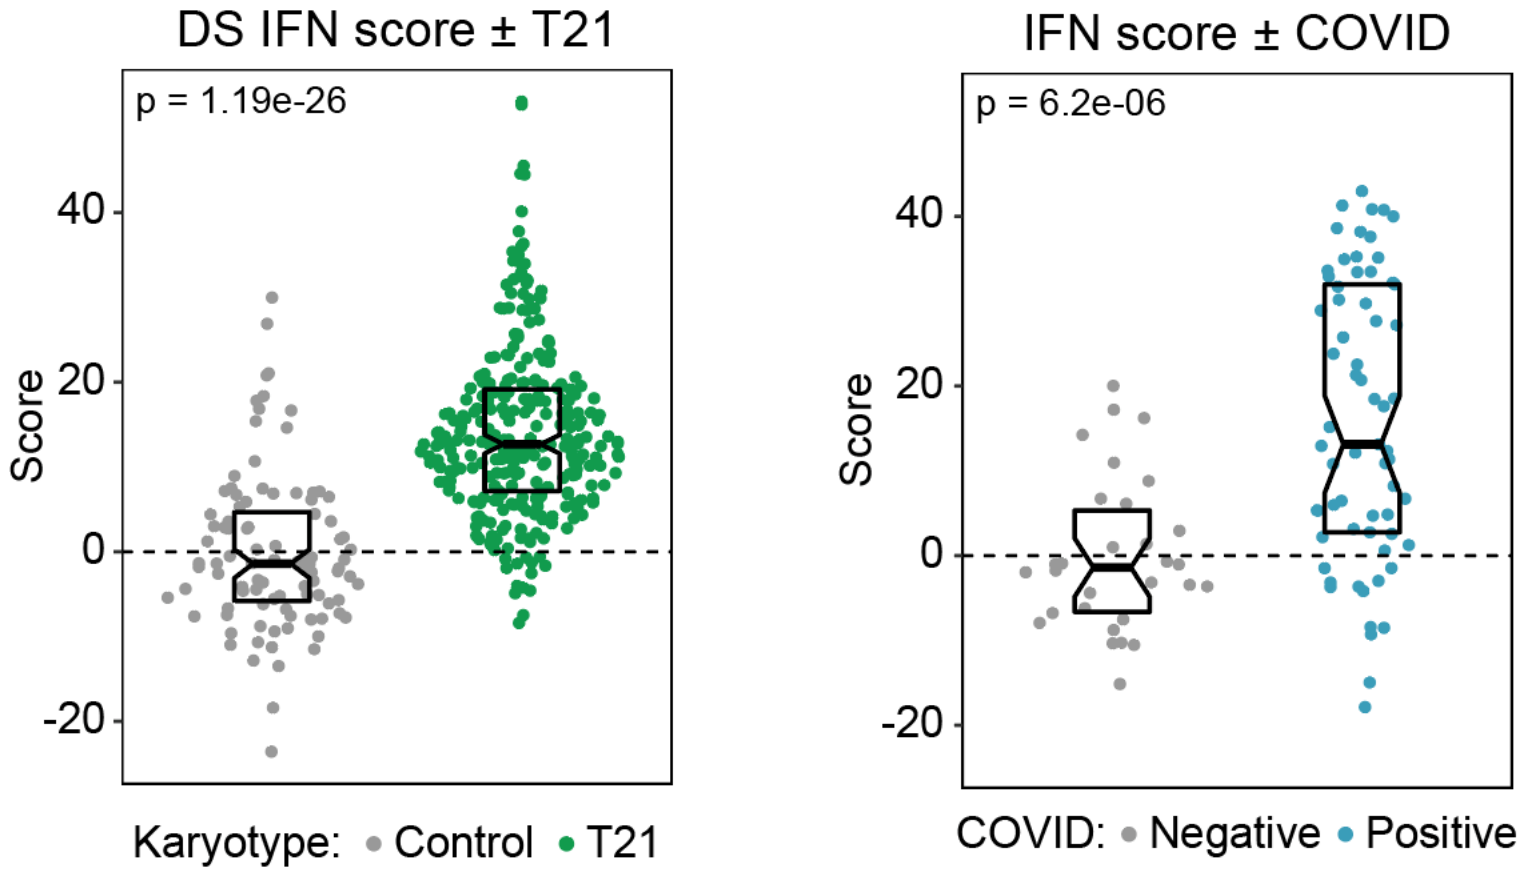
Hypotheses:

IFNR triplication causes elevated interferon responses, increased JAK/STAT signaling, and autoinflammation.

Interferon hyperactivity is a driver of pathology in Down syndrome.

The blood of people with Down syndrome looks like is fighting a viral infection

The hyperinflammation observed in Down syndrome is on par with that observed during a COVID-19 infection



IFN scores are commonly used to monitor the degree of IFN activity

T21: trisomy 21

Galbraith et al, Science Advances 2023

People with Down syndrome display ‘sterile inflammation’

Trisomy 21 causes changes in the circulating proteome indicative of chronic autoinflammation

Kelly D. Sullivan[1,2], Donald Evans[1], Ahwan Pandey[1,2], Thomas H. Hraha[3], Keith P. Smith[1], Neil Markham[1], Angela L. Rachubinski[4], Kristine Wolter-Warmerdam[5], Francis Hickey[5], Joaquin M. Espinosa[1,2,6] & Thomas Blumenthal[1,6,7]

SCIENTIFIC REPORTS

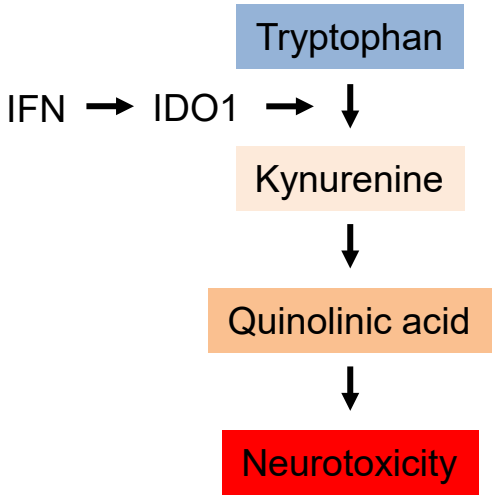
Costello

A plasma metabolomics analysis revealed widespread metabolic dysregulation in Down syndrome.

People with Down syndrome display activation of the kynurenine pathway, which produces neurotoxic metabolites:



IFN induces the kynurenine pathway

IDO1 is an IFN-inducible gene

Kynurenine and quinolinic acid are neurotoxic metabolites involved in many neurological conditions

Conclusion:

Interferon signaling is hyperactive in Down syndrome

Question:

What are the impacts of hyperactive interferon signaling in Down syndrome?

Could Down syndrome be understood as an **interferonopathy**?

Defining the impacts of IFN hyperactivity in mice

nature genetics

Article

https://doi.org/10.1038/s41588-023-01399-7

Triplication of the interferon receptor locus contributes to hallmarks of Down syndrome in a mouse model

2023

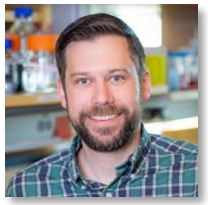
Tuttle

Araya

Galbraith

Sullivan



Work from the Maroun and Bianchi labs documented interferon hyperactivity in mouse models of Down syndrome carrying three copies of the receptors.

Early work from Maroun pointed to a pathogenic role for the receptors in mice.

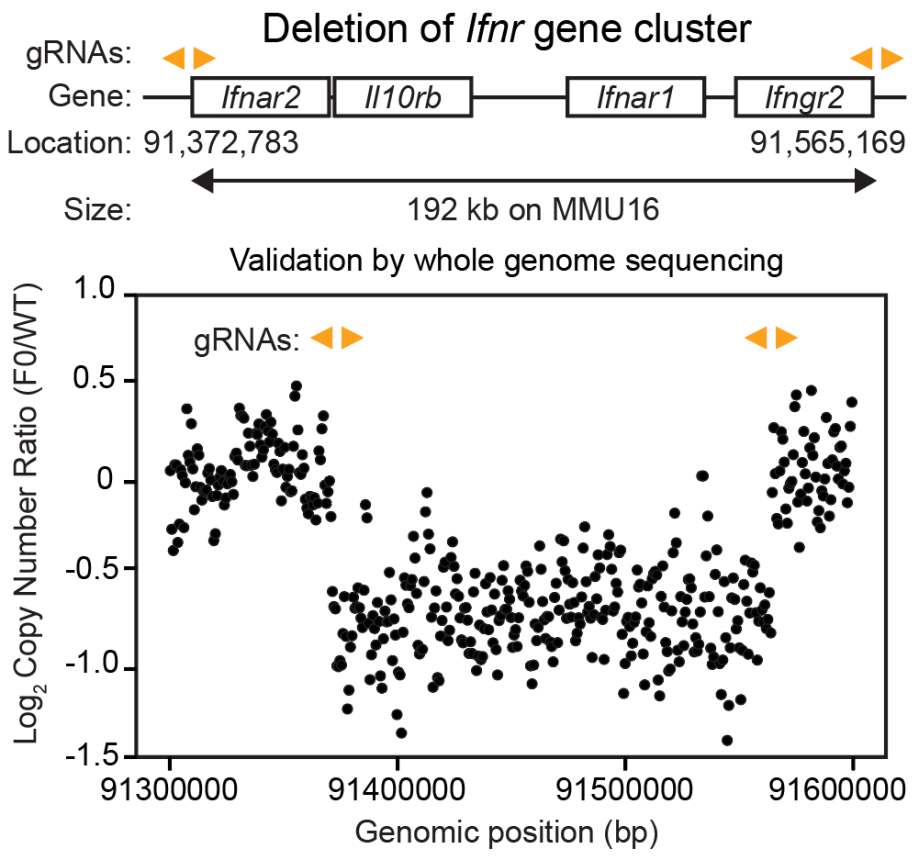
Maroun

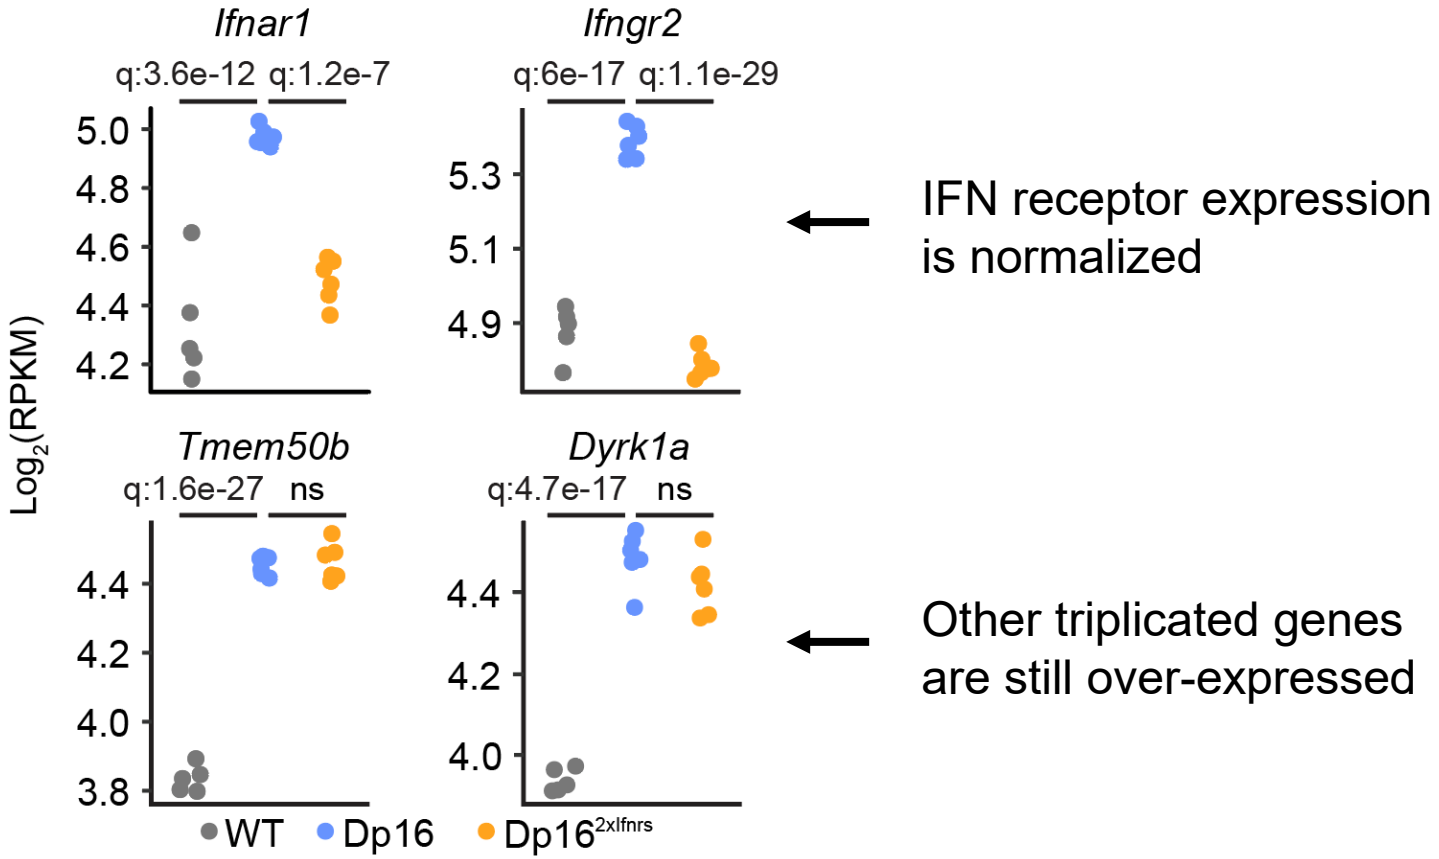
Bianchi

What would happen if we could ‘normalize’ receptor copy number?...

Normalizing interferon receptor gene dosage in mice

Clean deletion of the four interferon receptors using CRISPR technology while preserving triplication of ~120 other genes in this mouse model





WT: wild type (two copies) | Dp16: mouse model of Down syndrome | $Dp16^{2xIFNRs}$: Dp16 with two copies of receptors

Triplication of the interferon receptors contributes to:

- Global dysregulation of gene expression across multiple tissues.
- Lethal immune hypersensitivity.
- Congenital heart malformations.
- Developmental delays and cognitive deficits.
- Craniofacial abnormalities.

Key observation: the interferonopathy starts in the womb…

What would be the therapeutic benefit of attenuating IFN signaling in individuals with Down syndrome?

Waugh et al, *Nature Genetics* 2023

Would drugs that decrease the interferon response improve the health of persons with Down syndrome?

Approved therapies that decrease the interferon response: JAK inhibitors

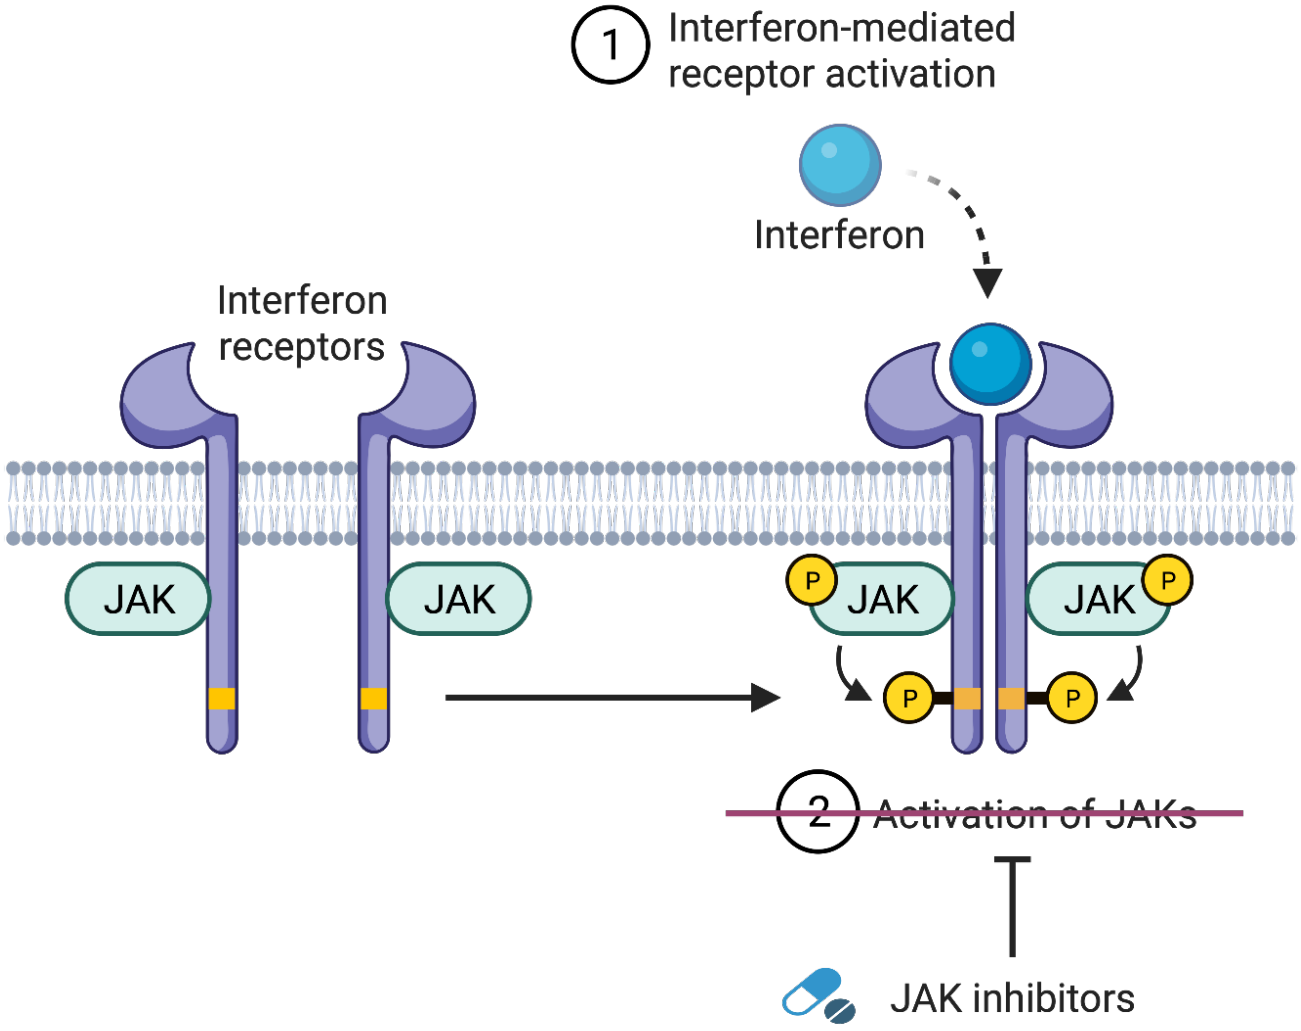
Target	JAK1/3	JAK1/2	JAK1	JAK1/2	JAK1
Rheumatoid arthritis	+	+	+		
Psoriatic arthritis	+		+		
Polyarticular course JIA	+				
Ulcerative colitis	+		+		
Atopic dermatitis			+		+
COVID-19		+			
Alopecia areata		+			
Chron's disease			+		
Polycythemia vera				+	
Ankylosing spondylitis			+		
Myelofibrosis				+	
GVHD				+	
Axial spondylarthritis			+		

There are many JAK inhibitors approved for many different indications.

These medicines are used by rheumatologists, dermatologists, gastroenterologists, hematologists and more!

Could JAK inhibitors 'normalize' the immune system in Down syndrome?

JAK inhibitors could attenuate the ill effects of interferon receptor overdose



JAK inhibitors are small molecules designed to inhibit the JAK enzymes acting ‘downstream’ of the interferon receptors.

JAK inhibitors are taken daily orally as pills and have a short ‘half-life’ in the body.

The action of JAK inhibitors is fully reversible, as they are rapidly cleared from the human body within hours.

First clinical trial for JAK inhibition in Down syndrome

Treating five immune skin conditions in one trial

Alopecia areata (patchy hair loss)

Hidradenitis suppurativa (boils)

Atopic dermatitis (eczema)

Psoriasis

Vitiligo

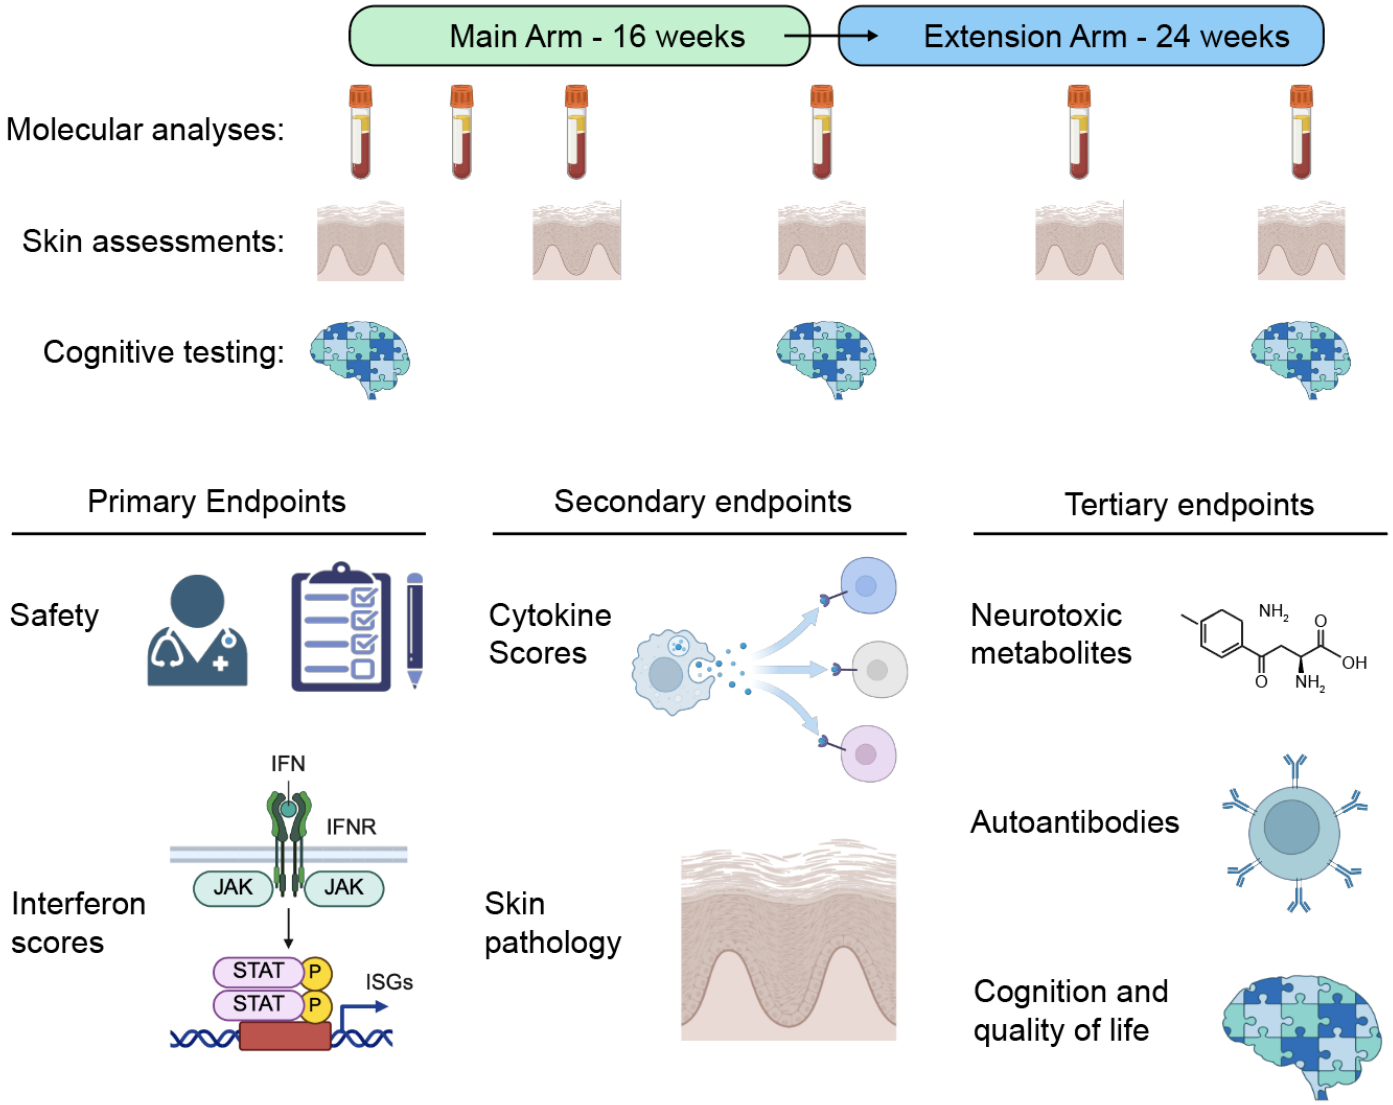
All five conditions are more common in people with Down syndrome

More than 35% of adults with Down syndrome have been affected by one of these conditions

4-9 months of treatment with the FDA-approved JAK inhibitor Tofacitinib (Xeljanz)

Funded by: NIH THE INCLUDE PROJECT NIH National Institute of Arthritis and Musculoskeletal and Skin Diseases

First clinical trial for JAK inhibition in Down syndrome



- ✓ Phase II, open label
- ✓ Ages 12-50
- ✓ 40 participants completing 16 weeks of treatment
- ✓ JAK inhibitor: tofacitinib

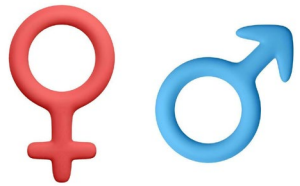
Key endpoints:

- Safety
- Immune markers
- Skin pathology
- Cognition

First clinical trial for JAK inhibition in Down syndrome

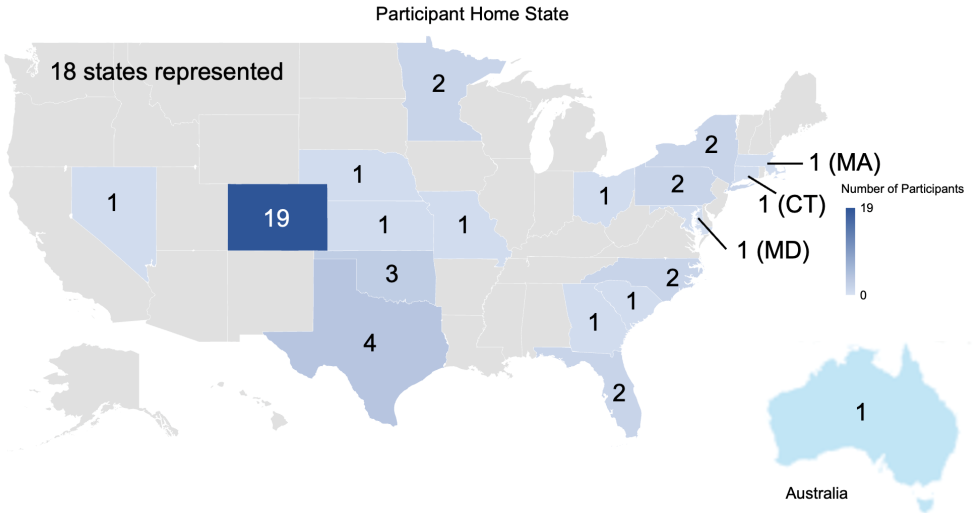
Top metrics:

Half males, half females



25% Hispanics | 15% Black or biracial

60% from outside of Colorado



Most common qualifying conditions:

1. Hidradenitis suppurativa
2. Alopecia areata
3. Psoriasis

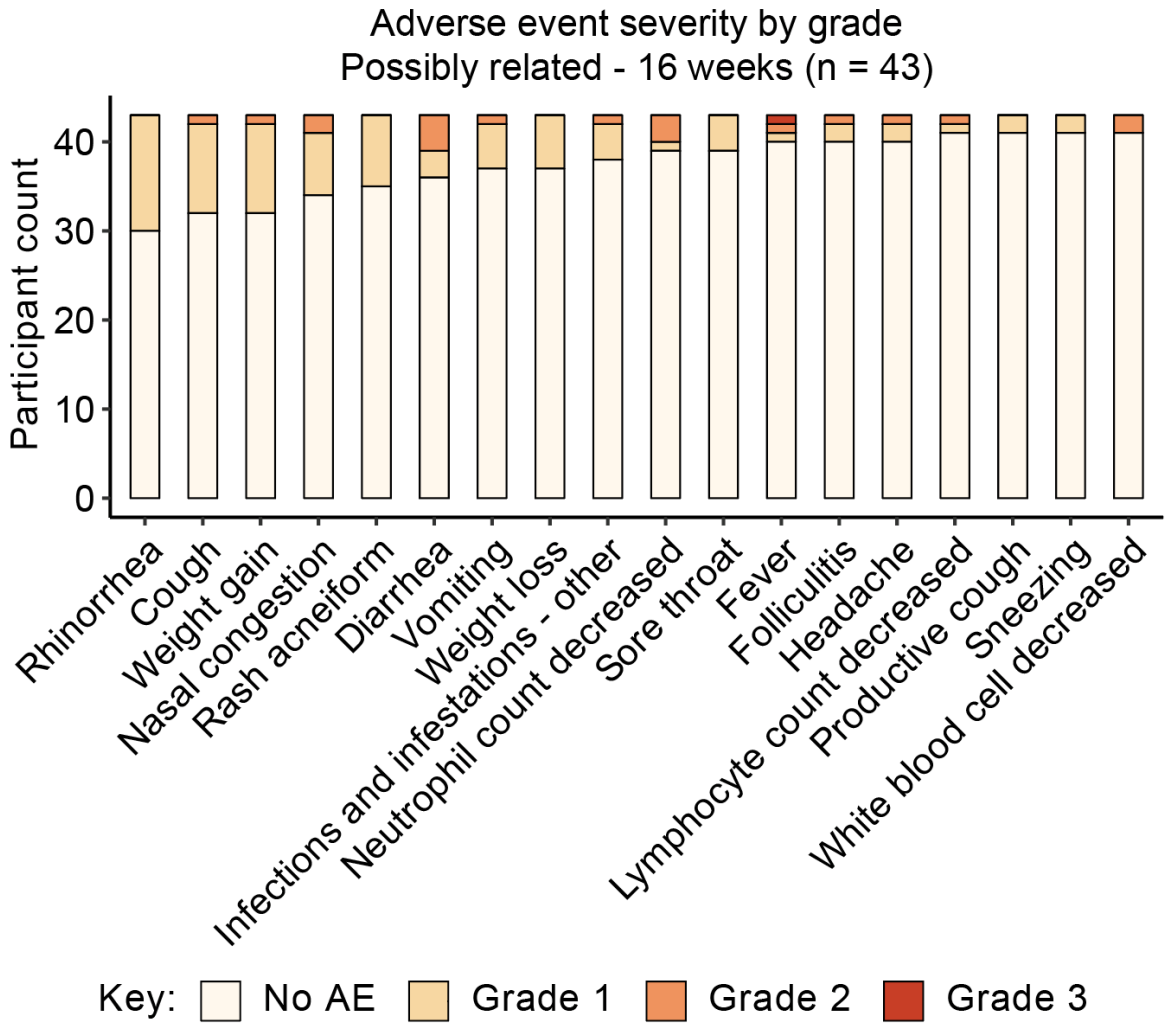
JAK inhibition is safe in Down syndrome

Safety endpoint was met!



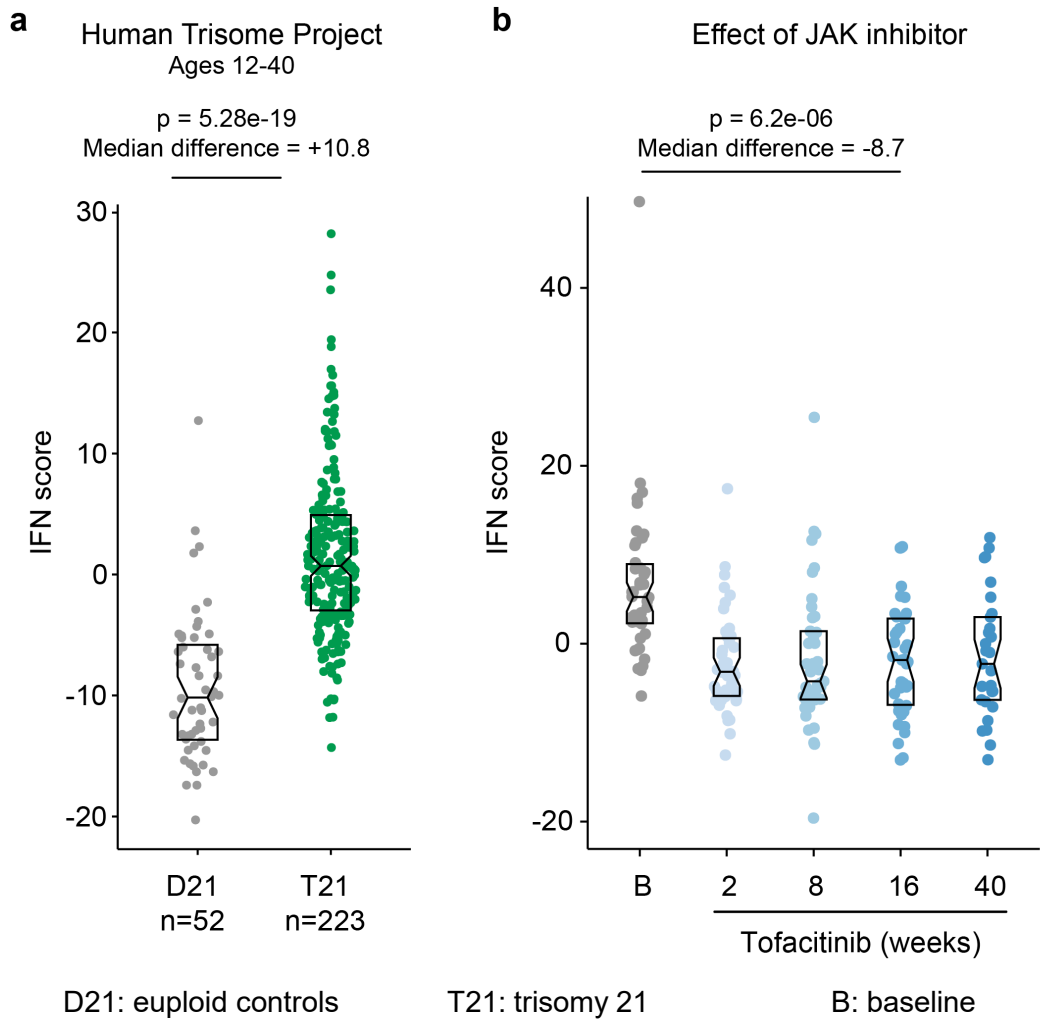
Safety profile reminiscent of that observed in the general population:

- Symptoms of upper respiratory infection
- Weight change
- Skin rash
- Mild clinical lab abnormalities

A single serious adverse event documented over 27.7 years of observation: an episode of thromboembolism in a participant taking oral contraceptive pills, which are known to increase risk of thromboembolism. Participant recovered favorably.

JAK inhibition reduces interferon scores and other biomarkers of autoinflammation

Normalization of IFN scores without overt immune suppression



D21: euploid controls T21: trisomy 21 B: baseline

The JAK inhibitor reduces IFN scores down to the range observed in the general population, not any lower.

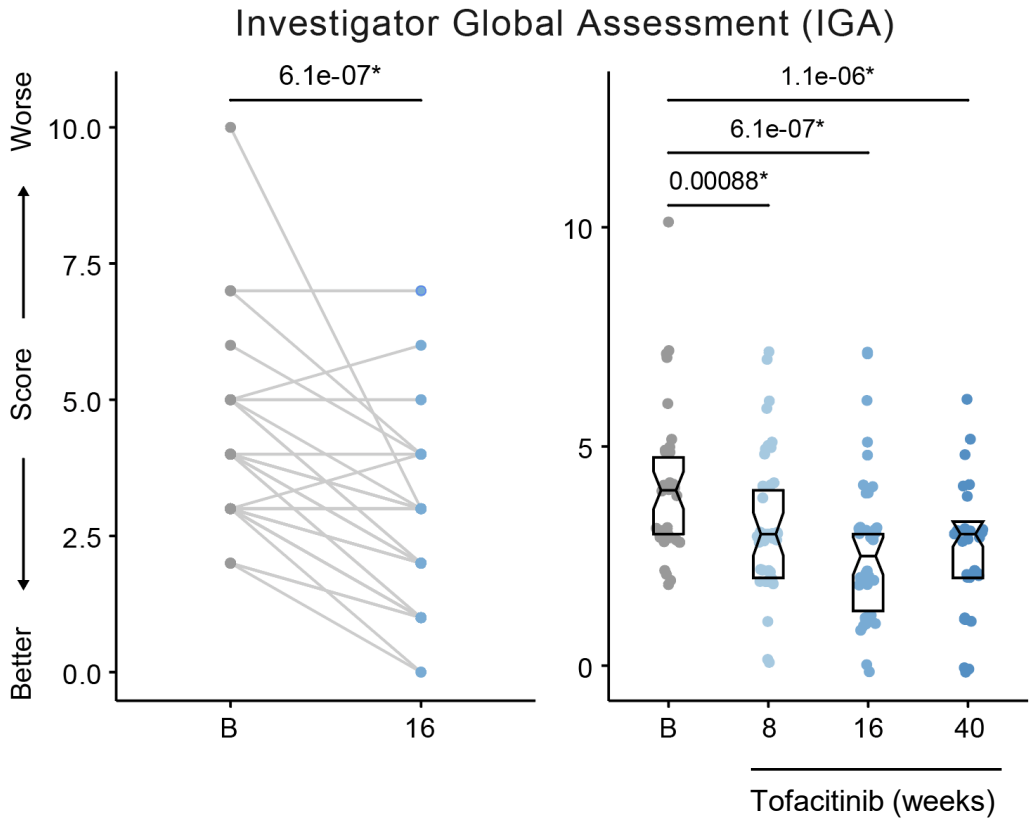
The JAK inhibitor also reduces cytokine scores and kynurenine pathway metabolites.

Endpoints met!

Galbraith et al, *Science Advances* 2023
Rachubinski et al, *eLIFE* 2024

JAK inhibition can be safely used to treat diverse immune skin conditions in Down syndrome

Improvement in skin pathology across multiple conditions



p-values from paired Student's t-test

The JAK inhibitor significantly reduced skin pathology as measured by:

- ✓ Investigator Global Assessment
- ✓ Dermatology Life Quality Index
- ✓ Modified Sartorius Score (for hidradenitis)
- ✓ Severity of Alopecia Tool (for alopecia)

Half of the participants secured prescriptions for the medicine after completing the trial…

JAK inhibition can be safely used for alopecia areata

Sometimes, one participant is all it takes…

Female, 28 years old, history of Down syndrome Regression Disorder (DSRD)

	NEPSY II (car)	NEPSY II (motorcycle)
Baseline		Week 16		
- Participant experienced DSRD for eight years before the trial.
- Before treatment, the participant was receiving electroconvulsive therapy (ECT) three times a week
- The benefits were so obvious that participant was prescribed tofacitinib ‘off-label’ by her neuroimmunologist, and both Pfizer and Medicaid agreed to pay for it…

Down Syndrome Regression Disorder (DSRD)

- A devastating condition characterized by rapid onset of catatonia, mutism, depersonalization, loss of ability to perform activities of daily living, hallucinations, delusions, and aggression.
- A subset of DSRD cases are associated with signs of immune dysregulation affecting the central nervous system (CNS).
- Is DSRD an autoimmune condition, akin to autoimmune encephalitis?

Children's Hospital Colorado

LINDA CRNIC INSTITUTE for DOWN SYNDROME

Funded by:

THE INCLUDE PROJECT

NIH Eunice Kennedy Shriver National Institute of Child Health and Human Development

Recruiting now!

A Phase II, *three-arm, open-label*, research-intensive trial

Lorazepam
Brand name: Ativan
Benzodiazepine

IVIG
Brand name: Gammagard
Intravenous Immune Globulin

Tofacitinib
Brand name: Xeljanz
JAK inhibitor

All three medicines studied in this trial are already FDA-approved for **other** medical conditions

The power of ‘drug repurposing’: this study benefits from extensive available data for all three drugs

Open label: participants will know which medicine they are taking

No placebo arm, but instead ‘a delayed treatment group’ for comparison

Why compare these three medicines?

Who would benefit the most from which medicine?

What are the diagnostic characteristics that could predict a good response?

Are there ‘biomarkers’ in the blood or cerebrospinal fluid that could match each participant to their best therapeutic option?

Developing a personalized medicine approach for the treatment of DSRD

Conclusions

- Interferon hyperactivity could cause many health issues in individuals with Down syndrome, such as autoimmune disorders, severe complications from lung viral infections (e.g., COVID19), and neurological disorders.
- Research into immune system dysregulation in Down syndrome has illuminated therapeutic strategies being tested in first-in-kind clinical trials (e.g., JAK inhibition).
- Restoring immune balance could have multidimensional benefits in Down syndrome, even perhaps from early development.

Outstanding questions

- What is the long-term safety profile of JAK inhibition in people with Down syndrome?
- What are all the possible benefits of immunomodulation in Down syndrome?
- How early could treatment start? Is pre-natal treatment even possible?
- Should everyone with Down syndrome be treated or only those with clinically evident autoimmunity?
