Training Objectives

After completing this training, participants will be able to:

- Describe the disproportionately higher rates of Sudden Unexpected Infant Death (SUID), Sudden Infant Death Syndrome (SIDS), and sleep-related causes of infant death for American Indian/Alaska Native (AI/AN) infants.
- Identify facts and myths about SIDS, and explain what is currently known about SIDS risk factors.
- Define actions that families and communities can take to reduce SIDS risk.
- Communicate safe sleep messages.
Chapter 1: Facts About SIDS

What are the facts about SUID and SIDS?
What is Sudden Unexpected Infant Death (SUID)?

- SUID refers to infant deaths that occur suddenly and unexpectedly.
Types of SUID

- SIDS
- Accidental suffocation
- Hypothermia/Hyperthermia
- Metabolic disorders
- Poisoning
- Unknown

Source: CDC, September 2008
Incidence of SUID

- Approximately 4,200 infants die of sleep-related SUID.
- One-half of these deaths are categorized as SIDS.

Source: Centers for Disease Control and Prevention (CDC), SUID and SIDS, September 4, 2012 - Website: http://www.cdc.gov/sids/
What is SIDS?

SIDS is the sudden death of an infant younger than 1 year of age that remains unexplained after a thorough case investigation, including:

- Performance of a complete autopsy;
- Examination of the death scene; and
- Review of the clinical history of the infant.

Incidence of SIDS

- SIDS rates are declining in the United States, but disparities still exist among certain populations.

SIDS is...

- The leading cause of infant death between 1 month and 1 year of age
- A sudden, silent medical disorder
- Determined after autopsy, exam of death scene, and review of medical records
- 2 times to 4 times more likely to occur in AI/AN babies
SIDS is NOT...

- Fully understood, but risks can be reduced
- Caused by suffocation
- Caused by diphtheria, pertussis and tetanus (DPT) vaccine, or other shots or vaccines
SIDS is NOT...

- Contagious
- Result of child abuse or neglect
- Caused by cribs
- Caused by choking or vomiting
- The cause of every unexpected infant death
Back Sleeping Does Not Cause Vomiting or Choking

When a baby is in the back sleeping position, the trachea lies on top of the esophagus.

Anything regurgitated or refluxed from the esophagus must work against gravity to be aspirated into the trachea.
Stomach Sleeping Could Cause Vomiting or Choking

When a baby is in the *stomach sleeping position*, anything regurgitated or refluxed will pool at the opening of the trachea, making it easier for the baby to aspirate or choke.
Proportion of Infant Deaths Due to SIDS

AI/AN SIDS Rates for Urban Indian Health Organization Counties 1997-2003*

What causes SIDS?

- Biological Basis for SIDS:
  - Brainstem abnormalities
  - Genetic susceptibility
  - Affected infants may lack coordination of vital systems: breathing, blood pressure, temperature, reflexes, waking, and sleeping

- But these alone aren’t likely to cause death.
What causes SIDS?

Triple Risk Theory

Critical Development Period

Vulnerable Infant

Outside Stressor(s)

SIDS

Adapted from Filiano & Kinney 1994.
SIDS Risk Factors

- Overheating
- Alcohol Use
- Commercial Tobacco Use
- Pregnancy-Related Factors
- Sleep Position
- Soft Sleeping Surfaces and Loose, Fluffy Bedding
- Bed Sharing
SIDS Risk Factors

Overheating

- Increases chance baby will sleep too deeply

- Can occur if:
  - Baby is overdressed;
  - Room is too warm; or
  - Baby is covered in too many blankets.

- Check for signs: sweating, damp hair, flushed cheeks, heat rash, rapid breathing
Alcohol Use  
(during pregnancy & after baby’s birth)  

- One binge episode during first 3 months of pregnancy increases risk of SIDS 8 times.  
- Any drinking 3 months prior to and during first 3 months of pregnancy increases risk 6 times.  
- Alcohol use during breastfeeding can cause drowsiness, deeper sleep, weakness, and decreased growth in the infant.
SIDS Risk Factors

Commercial Tobacco Use (during pregnancy & in baby’s living environment)

- Tobacco decreases growth and function of baby’s developing brain, nerves, and organs.
- Infants who die of SIDS have higher levels of nicotine in their lungs than infants who die from other causes.

SIDS Risk Factors

- Pregnancy-Related Factors
  - Not receiving early regular prenatal care
  - Preterm labor/birth and low birth weight
Lowering SIDS Risk

- **Sleep Position**
  - The most effective action that parents and caregivers can take to lower the risk for SIDS is to always place the baby on his or her back to sleep, for naps and at night.
  - Every sleep time counts!
Lowering SIDS Risk

- Sleep Surface and Sleep Environment
  - Firm sleep surface
  - No objects, toys, or loose bedding
  - No crib bumpers

- Overheating
  - No more than 1 layer more than what an adult would wear to be comfortable
Lowering SIDS Risk

- A blanket is not recommended, but if using a blanket, use “feet to foot” method:
  - Feet at end of crib
  - Blanket tucked under mattress
  - Blanket no higher than chest
  - Sleep clothing that is appropriate to room temperature
Lowering SIDS Risk

Alternative Sleep Surfaces*

* Babies should be placed on their backs. No data exists on the safety of these items. Caregivers must be careful about baby turning over and flipping the basket/box.
Lowering SIDS Risk

- Choose safe sleep locations.
- Use separate sleep area in the same room as parent or caregiver.
Lowering SIDS Risk

- Always place baby on his or her back to sleep—for naps and at night.
- Never place a baby to sleep or sleep with the baby on an armchair, couch, sofa, or waterbed.
- Remove soft items (pillows, toys, quilts, comforters, sheepskins) from the sleep area.
Lowering SIDS Risk

- Do not cover the baby with adult bedding.
- Do not sleep with baby if you have had alcohol, smoke tobacco, or take drugs or medicines that make you sleepy.
* Some health care providers in AI/AN communities suggest these actions *might reduce the risk of accidental suffocation:*

- Move bed away from walls and other furniture.
- Place mattress low to or on the floor.
- Place baby in the area just above where adult heads are in the bed.
- Do not allow siblings, other children, or pets in the bed.

*Remember, though, that the safest option for baby is a sleep area close to but separate from where others sleep.*
Lowering SIDS Risk

- Breastfeed your baby because it has a protective effect against SIDS.
- Give your baby a dry pacifier that is not attached to a string for naps and at night.
Lowering SIDS Risk

- Have Public Health Nurse visit the home.
  - Aberdeen Area Infant Mortality Study showed that infants were less likely to die of SIDS if their mothers received visits from a Public Health Nurse before and after giving birth.
The Following Do Not Reduce the Risk of SIDS

- These items should be avoided for use to reduce the risk of SIDS.
  - Commercial products (e.g., wedges, positioners) that claim to reduce SIDS.
  - Home health monitors that claim to reduce the risk of SIDS.
Risk Reduction

- Risk reduction is a behavioral change concept.
- Individuals make their own choices about what they are willing/able to change.
- Informed choice is our goal.
Remember Tummy Time!

- Give babies plenty of tummy time when they are awake and someone is watching.
Understanding the Messages Activity

Workstations:

- Learn how to put information into action:
  - Safe Sleep Environment
  - Risk Continuum
Who needs SIDS education?

- The Entire Community!
  - Parents, Parents-to-Be
  - Foster Parents & Families
  - Elders, Youth, Other Family and Friends
  - Emergency Personnel and Other First Responders
  - Hard-to-Reach and Underserved Groups
  - Child Care Providers
Be consistent!

- It is important to be consistent with your safe sleep messages:
  - Same information
  - Same messages
  - Same images and methods
- Why is it important? SIDS risk is 8 times higher when a baby used to sleeping on her/his back is placed on tummy to sleep (even for “just a nap”)!
Be effective and persistent.

- **Effective:**
  - Using fear, guilt, or shame is usually not effective in sustaining new or desirable behaviors.
  - Focusing on effective actions that people can take to reduce the risk of SIDS is a more effective and respectful tactic.

- **Persistent:**
  - Go to where the people are!
  - Use community outreach services.
  - Provide additional support for those affected by FASD, FAS, or other learning impairments and those who are hard to reach like those who are homeless.
Thank You for Your Efforts to Spread Safe Sleep Messages in Native Communities!

Optional Activity

The following slides demonstrate how to use the Toolkit Disk.
Healthy Native Babies Project Toolkit

Babies sleep safest on their backs.

One of the easiest ways to lower your baby’s risk of SIDS is to put him or her on their back to sleep, for naps and at night. Placing your baby on his or her back to sleep is the number one way to reduce the risk of SIDS.

G2. But won’t my baby choke if he or she always sleeps on his or her back?
A. No. Healthy babies automatically swallow or cough up fluids. There have been no reports of baby problems for babies who sleep on their backs.

Spread the word!

Make sure everyone who cares for your baby knows the safe sleep recommendations. Tell family members, grandparents, baby sitters, child care providers, and other caregivers to always place your baby on his or her back to sleep to reduce the risk of SIDS. Babies who usually sleep on their backs and are placed on their stomachs even for a nap are at very high risk for SIDS—no matter what time of day!

Enjoy your baby!

For more information on sleep position for babies, reducing the risk of SIDS, or the Healthy Native Babies Project, contact the SIDS Coalition at:

What is SIDS?
SIDS stands for Sudden Infant Death Syndrome. This term describes the unexpected and sudden death of an infant younger than 1 year of age. While there is no 100% effective way to prevent SIDS, there are steps to reduce the risk.

What should I know about SIDS?
Health care providers don’t know exactly what causes SIDS, but they do know:

- Babies who sleep on their stomachs are much more prone to die of SIDS than babies who sleep on their backs.
- Sleep position matters. Babies who sleep on their stomachs are more likely to die of SIDS than babies who sleep on their backs.
- Every sleep position counts. Babies who sleep on their backs but who are positioned on their stomach or sides are at very high risk for SIDS. So it’s important for everyone who cares for your baby to use the back to sleep position at all times.
- The back to sleep position is the safest and every sleep time counts.

What can I do to lower my baby’s risk of SIDS?
Here are 11 ways that you and others who care for your baby can reduce the risk of SIDS:

1. Always place your baby on his or her back to sleep, even at night. The back to sleep position is the safest and every sleep time counts, even naps.
2. Place your baby on a firm sleep surface, such as a crib, in a safety-approved crib mattress, covered by a fitted sheet. Never place your baby to sleep on pillows, quilts, stuffed animals, or other soft surfaces.
3. Keep soft objects, toys, and loose bedding out of your baby’s sleep area. Don’t use pillows, blankets, quilts, stuffed animals, or other soft objects in your baby’s sleep area and keep all items away from your baby’s face.
4. Do not smoke during pregnancy and do not allow smoking around your baby.
5. Do not drink alcohol while you are pregnant or breastfeeding. Alcohol use during pregnancy is a known cause of chemical and mental problems and increases SIDS risk.
6. Think about using a sleep, dry position when putting the baby to bed, but don’t force the baby to stay in
7. Keep your baby’s sleep area close to but separate from where you and others sleep. Your baby should not sleep in a couch or armchair with adults or other children, but he or she can sleep in the same room as you.
8. Do not let your baby overheat during sleep. Dress baby in light clothing and keep the room a temperature that is comfortable for an adult.
9. Avoid products that claim to reduce the risk of SIDS. Most products have not been tested to effectiveness or safety.
10. Reduce the chances that the smoke will develop on your baby’s bed. Please “Smoke Free” when you are awake and someone is in the room watching. Change the direction that your baby blows in the crib and avoid too much time in car seats, carriers, and bouncers.
11. Invite a Public Health Nurse (PHN) into your home. This is from a PHN panel support and reduce SIDS risk.

Toolkit
**Ma'heone ka'ėskoneho**

**Babies Sleep Safest on Their Backs.**
Always put your baby on his or her back to sleep, both for naps and night, to reduce the risk of Sudden Infant Death Syndrome (SIDS). Health care providers used to think that babies should sleep on their stomachs, but research now shows that babies are less likely to die of SIDS when they sleep on their backs.

**Q.** But won't my baby choke if he or she sleeps on his or her back?

**A.** No. Healthy babies automatically swallow or cough up fluids. There has been no increase in choking or other problems for babies who sleep on their backs.

For more information about SIDS, reducing SIDS risk or the Healthy Native Babies Project, contact the Back to Sleep campaign at 1-800-505-CRIB (2742) or http://www.nichd.nih.gov/SIDS.
Healthy Native Babies Project
Toolkit

Ma'heone ka’eskoneho
(Sudden Infant Death Syndrome)

Always place your baby on his or her back to sleep, for naps and at night.
Avoid products that claim to reduce the risk of SIDS.
Place your baby on a firm sleep surface, such as a safety-approved crib.
Remove soft objects, toys, and loose bedding from the baby's sleep area.
Don't smoke during pregnancy and don't allow smoking around your baby.
Don't drink alcohol when you are pregnant or breastfeeding.

You can reduce the risk of SIDS for your baby!
Thank you!
